Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

The S-58LM20A Series is a high-accuracy temperature sensor IC on a single chip, provides output voltage which is linear against the temperature change.
Each chip consists of a temperature sensor, a constant current circuit, and an operational amplifier.
The operating ambient temperature is from −55°C to 130°C. This IC has much better linearity than other conventional temperature sensors such as thermistor, it is possible to achieve the extensive application for temperature control.

■ Features

- Accuracy against temperature $\pm 2.5°C$ ($-55°C$ to $+130°C$)
- Linear output voltage -11.77 mV/°C Typ.

  Ta = $-30°C$:   2.205 V Typ.

  Ta = $+30°C$:   1.515 V Typ.

  Ta = $+130°C$:   0.303 V Typ.
- Nonlinearity $\pm 0.4\%$ Typ. (-20 to $+80°C$)
- Operation in wide range of power supply voltage V_{DD} = 2.4 to 5.5 V ($-30°C$ to $+130°C$)

  V_{DD} = 2.7 to 5.5 V ($-55°C$ to $+130°C$)
- Low current consumption 4.5 μA Typ. ($+25°C$) 6.0 μA Max. ($-55°C$ to $+130°C$)
- Built-in operational amplifier
- Output voltage referred to V_{SS}
- Lead-free, Sn 100%, halogen-free[1]

  *1. Refer to "■ **Product Name Structure**" for details.

■ Applications

- Compensation of high-frequency circuits such as cellular phones and radio equipment
- Compensation of oscillation frequency in crystal oscillator
- LCD contrast compensation
- Compensation of amplifier gain
- Compensation of auto focus circuits
- Temperature detection in battery management
- Overheating prevention for charged batteries or halogen lights

■ Explanation of Terms

1. Output voltage (V_OUT)

V_{OUT} indicates the output voltage at Ta = −30°C, Ta = +30°C, and Ta = +130°C.

Figure 8

2. Temperature Sensitivity (V$_{SE}$)

V$_{SE}$ is the temperature coefficient of output voltage which is calculated from an output voltage when Ta = −30°C and Ta = +130°C.
V$_{SE}$ is calculated from the following formula.

$$V_{SE} = \frac{\left[V_{OUT}{}^{*1} - V_{OUT}{}^{*2} \right]}{160^{*3}}$$

Output voltage

*2. V$_{OUT}$ value at Ta = −30°C [V]
*3. The difference of the temperature between Ta = +130°C and Ta = −30°C [°C]

ABLIC Inc.

3. Nonlinearity (ΔN_L)

ΔN_L is the nonlinearity of output voltage. Its deviation with the approximation line is shown below.
ΔN_L is calculated from the following formula.

$$\Delta N_L = \frac{a^{*1}}{b^{*2}} \times 100$$
*1. The maximum deviation of the actual measurement of output voltage (B) and an approximation line (A) in temperature $-20°C$ to $+80°C$. The approximation line is the one to be drawn so that "a" should be the minimum value.
*2. The difference of the actual measured value of output voltage when $-20°C$ and $+80°C$.

Figure 10

4. Line regulation (ΔV_{OUT1})

ΔV_{OUT1} indicates the dependency of output voltage against input voltage. This indicates how much the output voltage varies when changing the input voltage after fixing the output current constant.

5. Load regulation (ΔV_{OUT2})

ΔV_{OUT2} indicates the dependency of output voltage against output current. This indicates how much the output voltage varies when changing output current after fixing the input voltage constant.

6. Current consumption – Power supply voltage (ΔI_{DD1})

ΔI_{DD1} indicates the dependency of current consumption against power supply voltage. This indicates how much current consumption varies when changing the temperature after fixing an output current constant.

7. Current consumption － Temperature (ΔI_{DD2})

ΔI_{DD2} indicates the dependency of current consumption against temperature. This indicates how much current consumption varies when changing the temperature after fixing an output current constant.

■ **Precautions**

- Wire each pin of VDD, VSS and VOUT carefully in order to set them in low impedance when wiring an IC on a patterned board.

- In this IC, if load capacitance of the VOUT pin is large, VOUT pin voltage may oscillate. It is recommended not to use an external capacitor between the VOUT and VSS pin. When using an external capacitor, set near the VOUT pin.
  When connecting an A/D converter etc. to the VOUT pin, the input pin capacitance of the A/D converter and the parasitic capacitance component between wires are included as load capacitance.
  To prevent oscillation, it is recommended to use the following output load condition.

  Load capacitance of VOUT pin (C_{L1}) : 300 pF or less
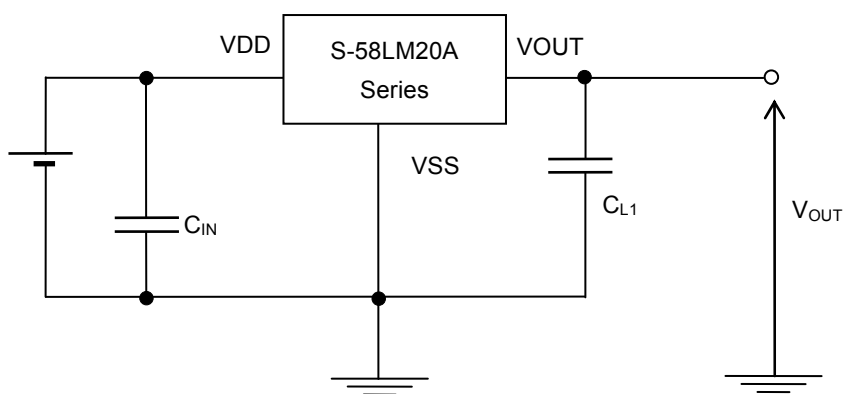

Figure 11

Caution The above connection diagram and constant will not guarantee successful operation. Perform through evaluation using the actual application to set the constant.

In this IC, it is necessary to add a capacitor from an output pin to GND with a series resistor in the ambience having excessive noise, as seen in **Figure 12** and **Figure 13**. In the combination shown in **Table 7**, a time constant against heat of this IC is much later than the time constant composed of RC, therefore it does not affect on the response time of this IC.

Table 7

R_{L2} (Ω)	C_{L2} (μF)
200	1
470	0.1
680	0.01
1 k	0.001
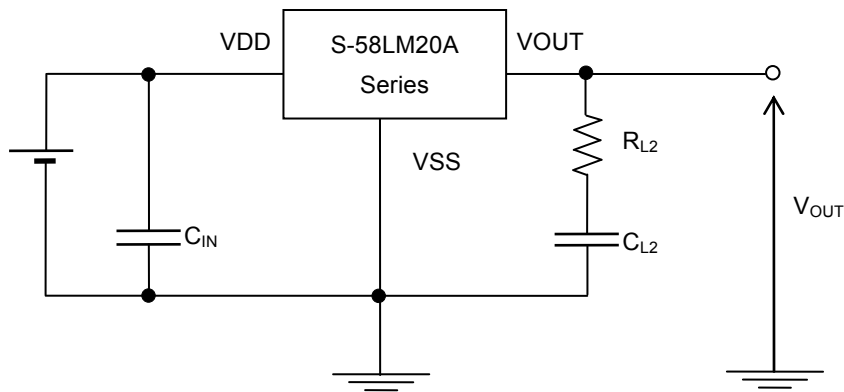

Figure 12
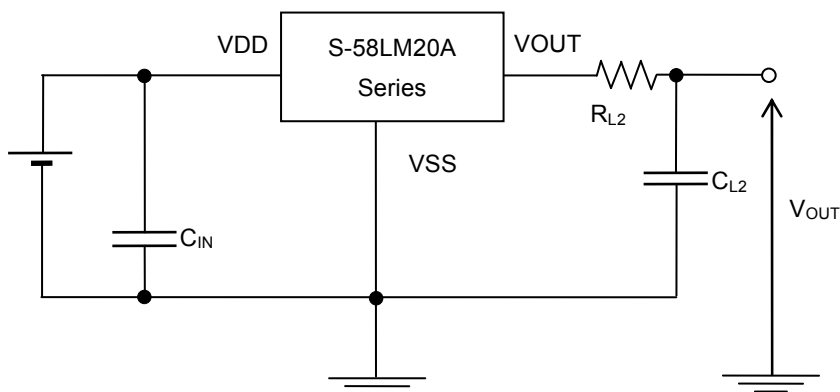

Figure 13

Caution **The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.**

- For stabilization, set a capacitor (C_{IN}) of approx. 0.1 μF between VDD and VSS pin.

- Do not connect a pull-up resistor to the output pin.

- The application condition for input voltage, output voltage and load voltage must not exceed the package power dissipation.

- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.

- Regarding the current at the output pin, refer to load regulation and footnote ***1** in **Table 6** "■ **Electrical Characteristics**".

- ABLIC Inc. claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.
