2 General Device Information

The XE162xM series (16-Bit Single-Chip
Real Time Signal Controller) is a part of the Infineon XE166 Family of full-feature single-chip CMOS microcontrollers. These devices extend the functionality and performance of the C166 Family in terms of instructions (MAC unit), peripherals, and speed. They combine high CPU performance (up to 80 million instructions per second) with extended peripheral functionality and enhanced IO capabilities. Optimized peripherals can be adapted flexibly to meet the application requirements. These derivatives utilize clock generation via PLL and internal or external clock sources. On-chip memory modules include program Flash, program RAM, and data RAM.

2.1 Pin Configuration and Definition

The pins of the XE162xM are described in detail in **Table 5**, which includes all alternate functions. For further explanations please refer to the footnotes at the end of the table. The following figure summarizes all pins, showing their locations on the four sides of the package.

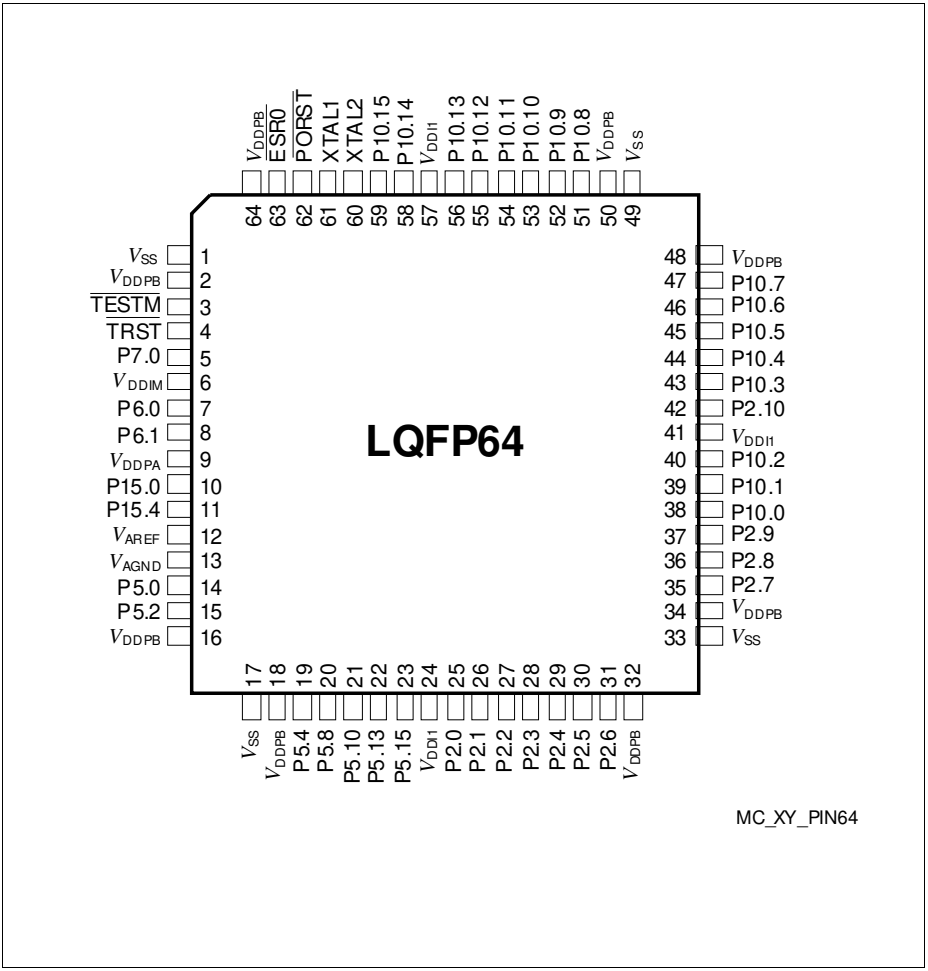

Figure 3 XE162xM Pin Configuration (top view)

Key to Pin Definitions

- **Ctrl.**: The output signal for a port pin is selected by bit field PC in the associated register Px_IOCRy. Output O0 is selected by setting the respective bit field PC to $1x00_B$, output O1 is selected by $1x01_B$, etc.
  Output signal OH is controlled by hardware.
- **Type**: Indicates the pad type and its power supply domain (A, B, M, 1).
  - St: Standard pad
  - Sp: Special pad e.g. XTALx
  - DP: Double pad - can be used as standard or high speed pad
  - In: Input only pad
  - PS: Power supply pad

Table 5 Pin Definitions and Functions

Pin	Symbol	Ctrl.	Type	Function
3	$\overline{\text{TESTM}}$	I	In/B	**Testmode Enable** Enables factory test modes, must be held HIGH for normal operation (connect to V_{DDPB}). An internal pull-up device will hold this pin high when nothing is driving it.
4	$\overline{\text{TRST}}$	I	In/B	**Test-System Reset Input** For normal system operation, pin $\overline{\text{TRST}}$ should be held low. A high level at this pin at the rising edge of $\overline{\text{PORST}}$ activates the XE162xM's debug system. In this case, pin $\overline{\text{TRST}}$ must be driven low once to reset the debug system. An internal pull-down device will hold this pin low when nothing is driving it.

Table 5 Pin Definitions and Functions (cont'd)

Pin	Symbol	Ctrl.	Type	Function
62	$\overline{\text{PORST}}$	I	In/B	**Power On Reset Input** A low level at this pin resets the XE162xM completely. A spike filter suppresses input pulses <10 ns. Input pulses >100 ns safely pass the filter. The minimum duration for a safe recognition should be 120 ns. An internal pull-up device will hold this pin high when nothing is driving it.
63	$\overline{\text{ESR0}}$	O0 / I	St/B	**External Service Request 0** After power-up, $\overline{\text{ESR0}}$ operates as open-drain bidirectional reset with a weak pull-up.

6	V_{DDIM}	-	PS/M	**Digital Core Supply Voltage for Domain M** Decouple with a ceramic capacitor, see Data Sheet for details.
24, 41, 57	V_{DDI1}	-	PS/1	**Digital Core Supply Voltage for Domain 1** Decouple with a ceramic capacitor, see Data Sheet for details. All V_{DDI1} pins must be connected to each other.
9	V_{DDPA}	-	PS/A	**Digital Pad Supply Voltage for Domain A** Connect decoupling capacitors to adjacent V_{DDP}/V_{SS} pin pairs as close as possible to the pins. *Note: The A/D_Converters and ports P5, P6 and P15 are fed from supply voltage V_{DDPA}.*
