

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

DESCRIPTION

The SG117A Series are 3-terminal positive adjustable voltage regulators which offer improved performance over the original 117 design. A major feature of the SG117A is reference voltage tolerance guaranteed within $\pm 1\%$, allowing an overall power supply tolerance to be better than 3% using inexpensive 1% resistors. Line and load regulation performance has been improved as well.

Additionally, the SG117A reference voltage is guaranteed not to exceed 2% when operating over the full load, line and power dissipation conditions. The SG117A adjustable regulators offer an improved solution for all positive voltage regulator requirements with load currents up to 1.5A.

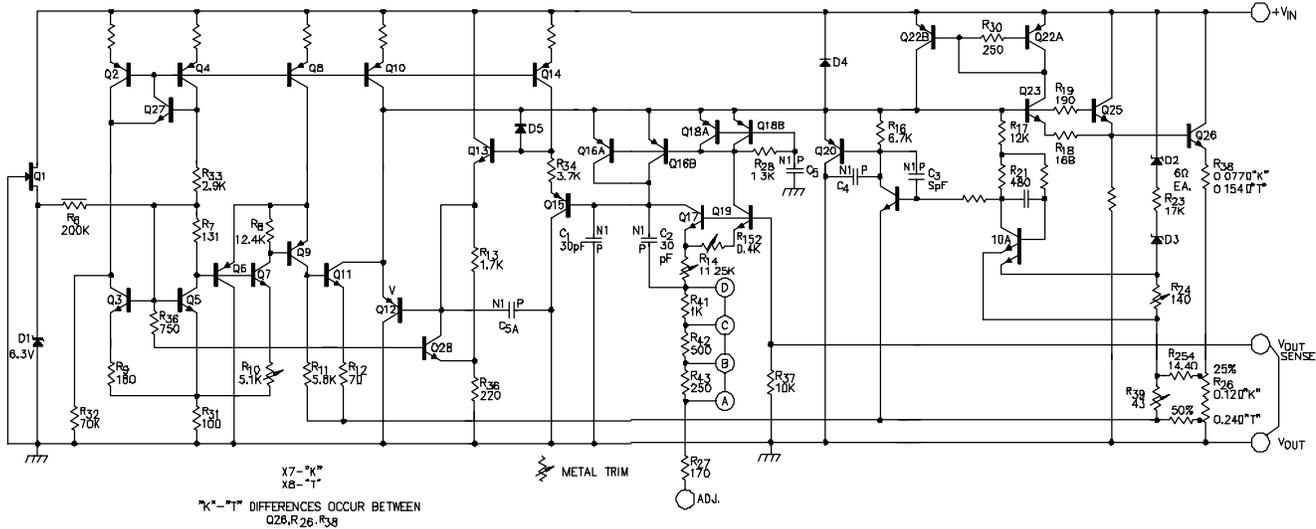

IMPORTANT: For the most current data, consult MICROSEMI's website: <http://www.microsemi.com>

KEY FEATURES

- 1% output voltage tolerance
- 0.01%/V line regulation
- 0.3% load regulation
- Min. 1.5A output current
- Available in hermetic TO-220

HIGH RELIABILITY FEATURES-SG117A/SG117

- Available to MIL-STD-883 and DSCC SMD
- MIL-M38510/11704BYA - JAN117K
- MIL-M38510/11703BXA - JAN117T
- LMI level "S" processing available

SCHEMATIC DIAGRAM

SG117 / 217 / 317 / 117A / 217A / 317A

1.5A Three Terminal Adj. Voltage Regulator

ABSOLUTE MAXIMUM RATINGS

Power Dissipation	Internally Limited
Input to Output Voltage Differential	40V
Storage Temperature Range	-65°C to 150°C
Operating Junction Temperature	150°C
Lead Temperature (Soldering 10 seconds).....	300°C

Note: Exceeding these ratings could cause damage to the device. All voltages are with respect to Ground. Currents are positive into, negative out of specified terminal.

THERMAL DATA

K 3 Terminal TO-3 Metal Can

THERMAL RESISTANCE-JUNCTION TO CASE, θ_{JC}	3.0°C/W
THERMAL RESISTANCE-JUNCTION TO AMBIENT, θ_{JA}	35°C/W

F 10-Pin Flatpack

THERMAL RESISTANCE-JUNCTION TO CASE, θ_{JC}	80°C/W
THERMAL RESISTANCE-JUNCTION TO AMBIENT, θ_{JA}	145°C/W

THERMAL RESISTANCE-JUNCTION TO CASE, θ_{JC}	3.5°C/W
THERMAL RESISTANCE-JUNCTION TO AMBIENT, θ_{JA}	42°C/W

IG 3-Pin TO-257 Hermetic (Isolated)

THERMAL RESISTANCE-JUNCTION TO CASE, θ_{JC}	3.5°C/W
THERMAL RESISTANCE-JUNCTION TO AMBIENT, θ_{JA}	42°C/W

L 20-Pin Ceramic (LCC) Leadless

THERMAL RESISTANCE-JUNCTION TO CASE, θ_{JC}	35°C/W
THERMAL RESISTANCE-JUNCTION TO AMBIENT, θ_{JA}	120°C/W

Junction Temperature Calculation: $T_J = T_A + (P_D \times \theta_{JA})$.

The θ_{JA} numbers are guidelines for the thermal performance of the device/pc-board system. All of the above assume no ambient airflow.

RECOMMENDED OPERATING CONDITIONS

Parameter	SGx17x			Units
	Min	Typ	Max	
Input Voltage Range	$V_{OUT} + 3.5$		37	V
Operating Junction Temperature Range	SG117A / SG117	-55	150	°C
Operating Junction Temperature Range	SG217A / SG217	-25	150	°C
Operating Junction Temperature Range	SG317A / SG317	0	125	°C

Note 2: Range Over which the device is functional.

Note 3: These ratings are applicable for junction temperatures of less than 150°C

ELECTRICAL CHARACTERISTICS

Unless otherwise specified, these specifications apply over the full operating ambient temperature for the SG117A / SG117 with $-55^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$, the SG217A / SG217 with $-25^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, and the SG317A / SG317 with $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, $V_{IN} - V_{OUT} = 5.0\text{V}$ and for $I_{OUT} = 500\text{mA}$ (K,R, G, and IG) and $I_{OUT} = 100\text{mA}$ (T, F, and L packages). Although power dissipation is internally limited, these specifications are applicable for power dissipations of 2W for the T and L packages, and 20W for the K, R, G, and IG packages. I_{MAX} is 1.5A for the K, R, G, and IG packages and 500m for the T, F, and L packages. Low duty cycle pulse testing techniques are used which maintains junction and case temperatures equal to the ambient temperature.

APPLICATION INFORMATION
GENERAL

The SG117A develops a 1.25V reference voltage between the output and the adjustable terminal (see Figure 1). By placing a resistor, R_1 between these two terminals, a constant current is caused to flow through R_1 and down through R_2 to set the overall output voltage. Normally this current is the specified minimum load current of 5mA or 10mA.

Figure 17 – Basic Regulator Circuit

Because I_{ADJ} is very small and constant when compared with the current through R_1 , it represents a small error and can usually be ignored.

It is easily seen from the above equation, that even if the resistors were of exact value, the accuracy of the output is limited by the accuracy of V_{REF} . Earlier adjustable regulators had a reference tolerance of $\pm 4\%$. This tolerance is dangerously close to the $\pm 5\%$ supply tolerance required in many logic and analog systems. Further, many 1% resistors can drift $0.01\%^\circ\text{C}$ adding another 1% to the output voltage tolerance.

For example, using 2% resistors and $\pm 4\%$ tolerance for V_{REF} , calculations will show that the expected range of a 5V regulator design would be $4.66\text{V} \leq V_{OUT} \leq 5.36\text{V}$ or approximately $\pm 7\%$. If the same example were used for a 15V regulator, the expected tolerance would be $\pm 8\%$. With these results most applications require some method of trimming, usually a trim pot. This solution is expensive and not conducive to volume production.

One of the enhancements of Silicon General's adjustable regulators over existing devices is tightened initial tolerance. This allows relatively inexpensive 1% or 2% film resistors to be used for R_1 and R_2 while setting output voltage within an acceptable tolerance range.

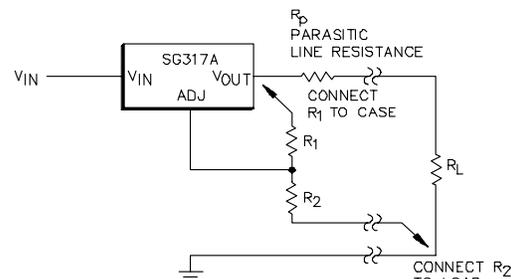

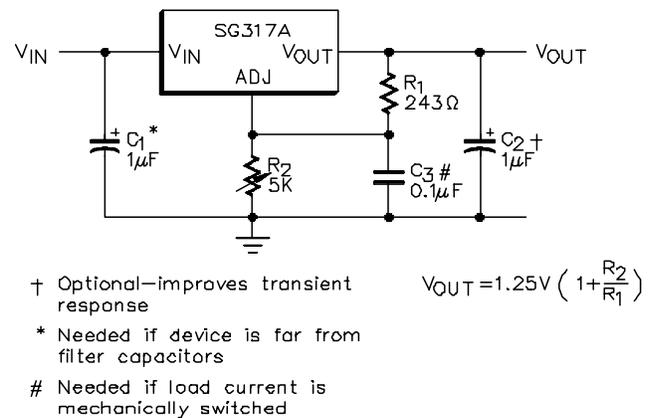

With a guaranteed 1% reference, a 5V power supply design, using $\pm 2\%$ resistors, would have a worse case manufacturing tolerance of $\pm 4\%$. If 1% resistors were used, the tolerance would drop to $\pm 2.5\%$. A plot of the worst case output voltage tolerance as a function of resistor tolerance is shown on the front page.

For convenience, a table of standard 1% resistor values is shown below

Table of 1/2% and 1% Standard Resistance Values

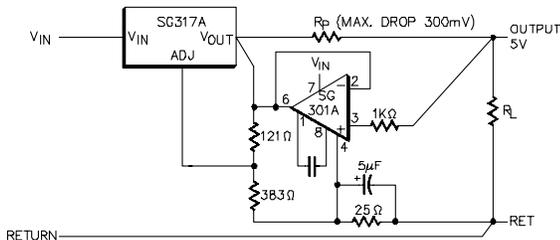

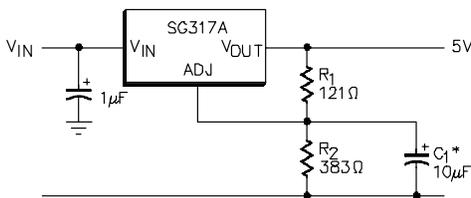

1.00	1.47	2.15	3.16	4.64	6.81
1.02	1.50	2.21	3.24	4.75	6.98
1.05	1.54	2.26	3.32	4.87	7.15
1.07	1.58	2.32	3.40	4.99	7.32
1.10	1.62	2.37	3.48	5.11	7.50
1.13	1.65	2.43	3.57	5.23	7.68
1.15	1.69	2.49	3.65	5.36	7.87
1.18	1.74	2.55	3.74	5.49	8.06
1.21	1.78	2.61	3.83	5.62	8.25
1.24	1.82	2.67	3.92	5.76	8.45
1.27	1.87	2.74	4.02	5.90	8.66
1.30	1.91	2.80	4.12	6.04	8.87
1.33	1.96	2.87	4.22	6.19	9.09
1.37	2.00	2.94	4.32	6.34	9.31
1.40	2.05	3.01	4.42	6.49	9.53
1.43	2.10	3.09	4.53	6.65	9.76

Standard Resistance Values are obtained from the Decade Table by multiplying by multiples of 10. As an example: 1.21 can represent 1.21Ω, 12.1Ω, 121Ω, 1.21kΩ, etc.

Figure 18 – Connections for Best Load Regulation

Figure 19 – 1.2V – 25V Adjustable Regulator

APPLICATION INFORMATION (CONTINUED)
BYPASS CAPACITORS

Input bypassing using a 1µF tantalum or 25µF electrolytic is recommended when the input filter capacitors are more than 5 inches from the device. A 0.1µF bypass capacitor on the ADJUST pin is required if the load current varies by more than 1A/µsec. Improved ripple rejection (80dB) can be accomplished by adding a 10µF capacitor from the adjust pin to ground. For improved AC transient response and to prevent the possibility of oscillation due to unknown reactive load, a 1µF capacitor is also recommended at the output. Because of their low impedance at high frequencies, the best type of capacitor to use is solid tantalum.

Figure 20 – Remote Sensing

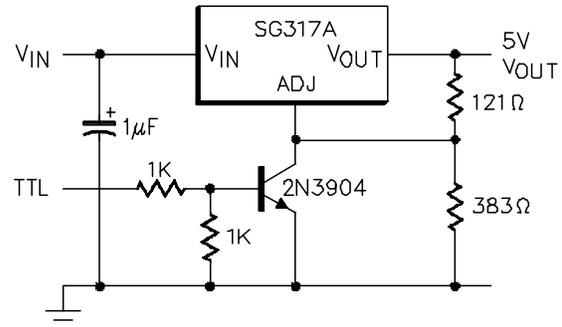

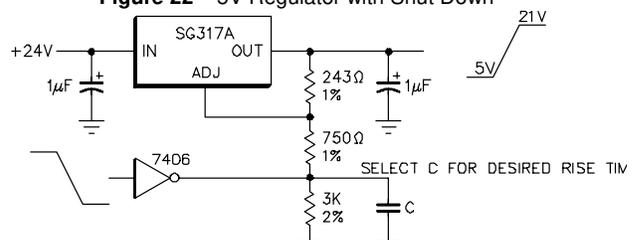

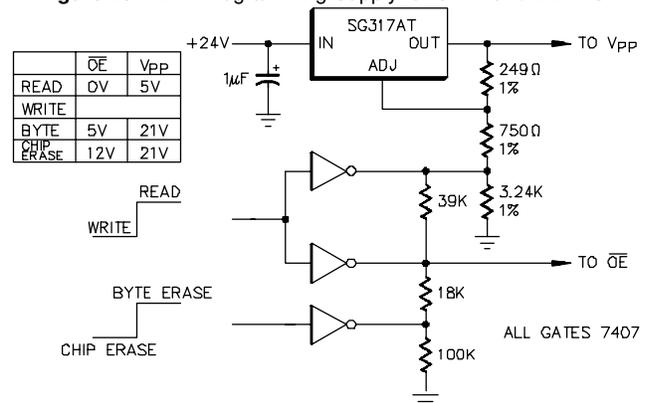

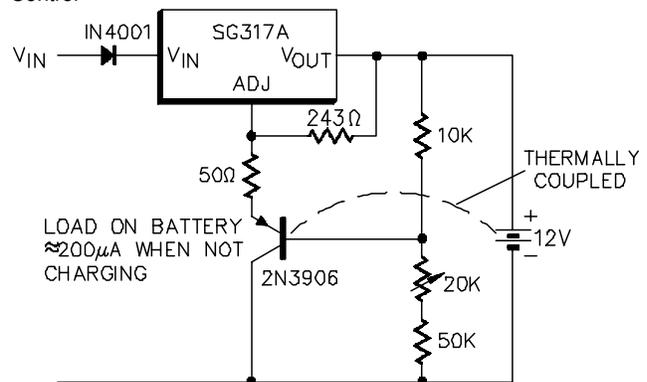

*C₁ Improves Ripple Rejection. X_C should be small compared to R₂.

Figure 21 – Improving Ripple Rejection
LOAD REGULATION

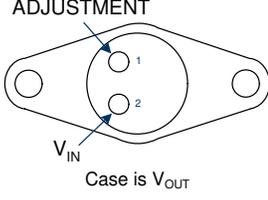

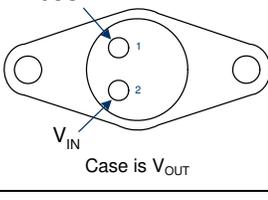

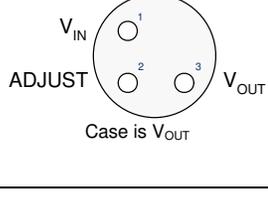

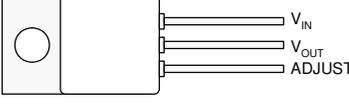

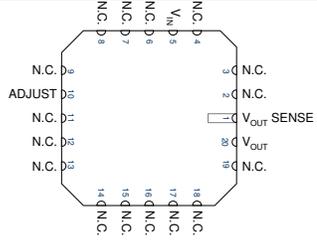

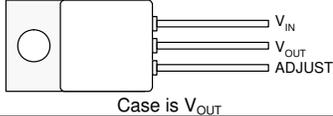

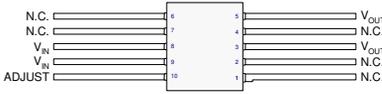

Because the SG117A is a three-terminal device, it is not possible to provide true remote load sensing. Load regulation will be limited by the resistance of the wire connecting the regulator to the load. For the data sheet specification, regulation is measured at the bottom of the package. Negative side sensing is a true Kelvin connection, with the bottom of the output divider returned to the negative side of the load. Although it may not be immediately obvious, best load regulation is obtained when the top of the divider is connected directly to the case, not to the load. This is illustrated in Figure 18. If R₁ were connected to the load, the effective resistance between the regulator and the load would be

$$R_p \cdot \left(\frac{R_2 + R_1}{R_1} \right), R_p = \text{Parasitic Line Resistance}$$

Connected as shown, R_p is not multiplied by the divider ratio. R_p is about 0.004Ω per foot using 16 gauge wire. This translates to 4mV/ft. at 1A load current, so it is important to keep the positive lead between regulator and load as short as possible.
