2. Crystal Recommendations

If using a crystal input, the device requires a parallel resonance crystal.

Table 6. Crystal Recommendations

Frequency (Fund)	Cut	Loading	Load Cap	ESR	Drive	Shunt Cap (max)	Motional (max)	Tolerance (max)	Stability (max)	Aging (max)
25 MHz	AT	Parallel	12–15 pF	<50 Ω	>150 μ W	5 pF	0.016 pF	35 ppm	30 ppm	5 ppm

2.1. Crystal Loading

Crystal loading is critical in achieving low ppm performance. To realize low ppm performance, use the total capacitance the crystal sees to calculate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using two trim capacitors. It is important that the trim capacitors are in series with the crystal.

Figure 1. Crystal Capacitive Clarification

2.2. Calculating Load Capacitors

In addition to the standard external trim capacitors, consider the trace capacitance and pin capacitance to calculate the crystal loading correctly. Again, the capacitance on each side is in series with the crystal. The total capacitance on both sides is twice the specified crystal load capacitance (CL). Trim capacitors are calculated to provide equal capacitive loading on both sides.

Figure 2. Crystal Loading Example

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$C_e = 2 \times CL - (C_s + C_i)$$

Total Capacitance (as seen by the crystal)

$$CL_e = \frac{1}{\left(\frac{1}{C_{e1} + C_{s1} + C_{i1}} + \frac{1}{C_{e2} + C_{s2} + C_{i2}} \right)}$$

- CL: Crystal load capacitance
- CL_e: Actual loading seen by crystal using standard value trim capacitors
- C_e: External trim capacitors
- C_s: Stray capacitance (terraced)
- C_i: Internal capacitance (lead frame, bond wires, etc.)
