

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Clock Generator for Intel Eaglelake Chipset

Features

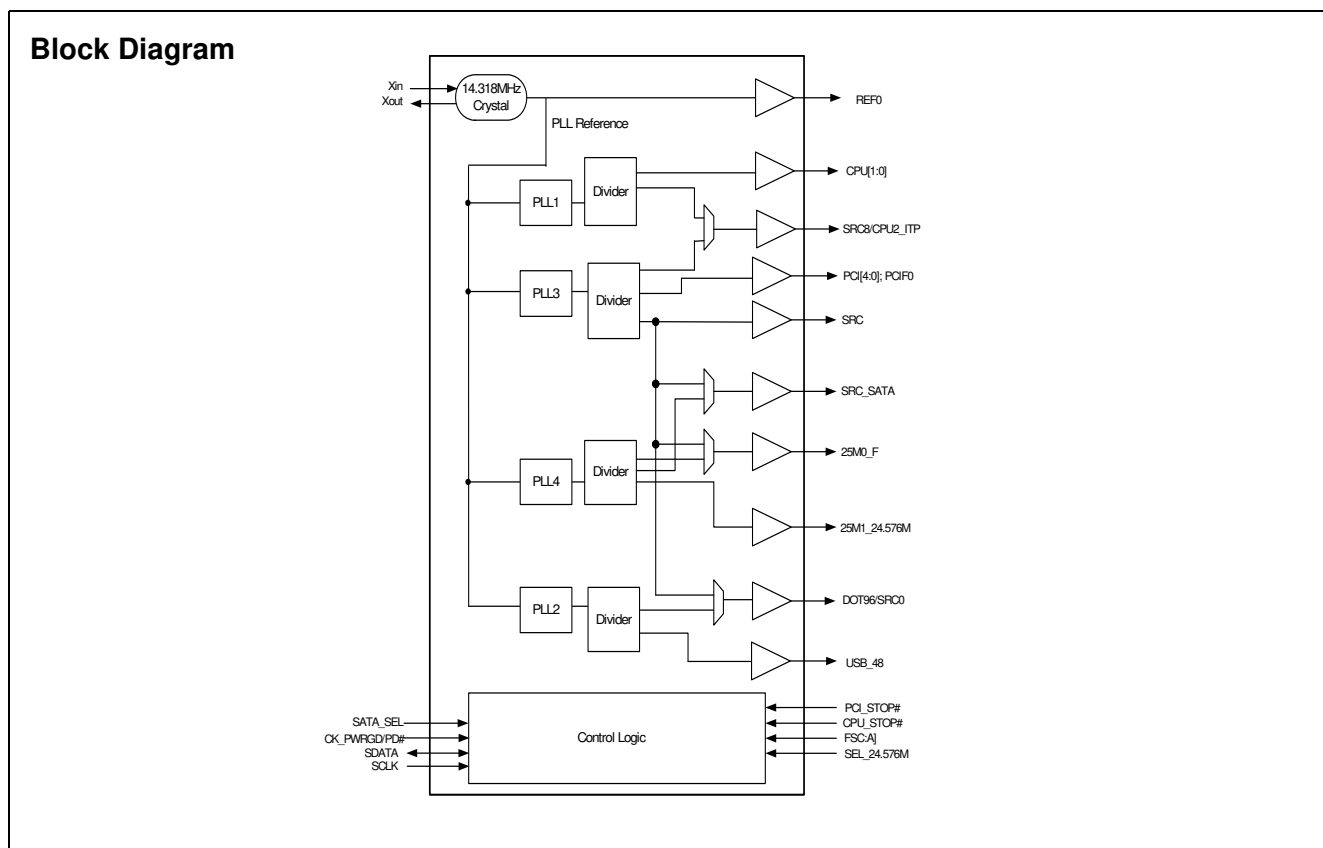

- Compliant to Intel® CK505
- Low power push-pull type differential output buffers
- Integrated voltage regulator
- Integrated resistors on differential clocks
- Scalable low voltage VDD_IO (3.3V to 1.05V)
- Differential CPU clocks with selectable frequency
- 100 MHz Differential SRC clocks
- 96 MHz Differential DOT clock
- 48 MHz USB clocks
- 33 MHz PCI clock
- 25MHz Free run for WOL
- Selectable 25MHz/24.576MHz
- Buffered Reference Clock 14.318 MHz
- Low-voltage frequency select input
- I²C support with readback capabilities
- Triangular Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction
- 3.3V Power supply
- 64-pin TSSOP packages

CPU	SRC	PCI	REF	DOT96	USB_48	24.576M	25M

Pin Configuration

* Internal Pull-Down

64-TSSOP Pin Definitions

Pin No.	Name	Type	Description
1	PCI0 / CR#_A	I/O, SE	<p>33 MHz Clock/3.3V Clock Request # Input Mappable via I2C to control either SRC 0 or SRC 2. Default PCI0. To configure this pin to serve as a Clock Request pin for either SRC pair 2 or pair 0 using the CR#_A_EN bit located in byte 5 bit 7, first disable PCI output (Hi-z) in byte 2, bit 1. 0 = PCI0 enabled (default) 1 = CR#_A enabled. Byte 5, bit 6 controls whether CR#_A controls SRC0 or SRC2 pair Byte 5, bit 6: 0 = CR#_A controls SRC0 pair (default) 1 = CR#_A controls SRC2 pair</p>
2	VDD_PCI	PWR	3.3V Power supply for PCI PLL.
3	PCI1 / CR#_B	I/O, SE	<p>33 MHz Clock/3.3V Clock Request # Input Mappable via I2C to control either SRC 1 or SRC 4. Default PCI1. To configure this pin to serve as a Clock Request pin for either SRC pair 1 or pair 4 using the CR#_B_EN bit located in byte 5, bit 5, first disable PCI output (Hi-z) in byte 2, bit 1. 0 = PCI1 enabled (default) 1 = CR#_B enabled. Byte 5, bit 4 controls whether CR#_B controls SRC1 or SRC4 pair Byte 5, bit 4: 0 = CR#_B controls SRC1 pair (default) 1 = CR#_B controls SRC4 pair</p>
4	PCI_2	O, SE	33 MHz clock.

64-TSSOP Pin Definitions

Pin No.	Name	Type	Description
5	PCI_3	O, SE	33 MHz clock.
6	PCI4 /SRC5_EN	I/O, SE	33 MHz clock output/3.3V-tolerant input for SRC enable (Sampled on CKPWRGD assertion) 1 = SRC5, 0 =CPU_STOP#/PCI_STOP#
7	PCIF_0/ITP_EN	I/O, SE	3.3V LVTTTL input to enable SRC8 or CPU2_ITP/33 MHz clock output. (sampled on the CK_PWRGD assertion) 1 = CPU2_ITP, 0 = SRC8
8	VSS_PCI	GND	Ground for outputs.
9	VDD_48	PWR	3.3V Power supply for outputs and PLL.
10	USB_48/FSA	I/O	3.3V tolerant input for CPU frequency selection/48 MHz clock output. Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.
11	VSS_48	GND	Ground for outputs.
12	VDD_IO	PWR	3.3V-1.05V Power supply for outputs.
13	SRC0/DOT96T	O, DIF	100 MHz Differential serial reference clocks/Fixed 96 MHz clock output. Selected via I2C default is SRC0.
14	SRC0#/DOT96#	O, DIF	100 MHz Differential serial reference clocks/Fixed 96 MHz clock output. Selected via I2C default is SRC0.
15	VSS_IO	GND	Ground for PLL2.
16	VDD_PLL3	PWR	3.3V Power supply for PLL3
17	SRC1/25M0_F	O, SE	100 MHz Differential serial reference clocks/ Free run 25MHz clock output
18	SRC1#/25M1_24.576M	O, SE	100 MHz Differential serial reference clocks/ 25MHz clock output/24.576MHz clock output
19	VSS_PLL3	GND	Ground for PLL3.
20	VDD_PLL3_IO	PWR	3.3V-1.05V power supply for PLL3
21	SRC2_SATA	O, DIF	100 MHz Differential serial reference clocks.
22	SRC2#_SATA#	O, DIF	100 MHz Differential serial reference clocks.
23	VSS_SRC	GND	Ground for outputs.
24	SRC3 / CR#_C	I/O, DIF	100 MHz differential serial reference clock output /3.3V Clock Request #_C/D input Selected via CR#_C_EN/CR#_D_EN bit located in byte 5 bit 3and 1. The CR#_C_SEL and CR#_D_SEL bits in byte 5 bit 2 and 0 will select which SRC to stop when asserted
25	SRC3# / CR#_D	I/O, DIF	100 MHz differential serial reference clock output/3.3V Clock Request #_C/D input Selected via CR#_C_EN/CR#_D_EN bit located in byte 5 bit 3and 1. The CR#_C_SEL and CR#_D_SEL bits in byte 5 bit 2 and 0 will select which SRC to stop when asserted
26	VDD_SRC_IO	PWR	3.3V-1.05V power supply for SRC outputs.
27	SRC4	O, DIF	100 MHz Differential serial reference clocks.
28	SRC4#	O, DIF	100 MHz Differential serial reference clocks.
29	VSS_SRC	GND	Ground for outputs.
30	SRC9	O, DIF	100 MHz Differential serial reference clocks.
31	SRC9#	O, DIF	100 MHz Differential serial reference clocks.
32	SRC11#/ CR#_G	I/O, DIF	100 MHz differential serial reference clocks/3.3V CR#_G Input. Selected via CR#_G_EN/CR#_H_EN bit located in byte 6 bit 5 and 4. When selected, CR#_G controls SRC9, CR#_H controls SRC10
33	SRC11/ CR#_H	I/O, DIF	100 MHz Differential serial reference clocks/3.3V CR#_H Input. Selected via CR#_G_EN/CR#_H_EN bit located in byte 6 bit 5 and 4. When selected, CR#_G controls SRC9, CR#_H controls SRC10

64-TSSOP Pin Definitions

Pin No.	Name	Type	Description
34	SRC10	O, DIF	100 MHz Differential serial reference clocks.
35	SRC#10	O, DIF	100 MHz Differential serial reference clocks.
36	VDD_SRC_IO	PWR	3.3V-1.05V power supply for SRC outputs.
37	CPU_STOP#/SRC5#	I/O, Dif	3.3V tolerant input for stopping CPU outputs./100 MHz Differential serial reference clocks. The option is selected by SRC5_EN
38	PCI_STOP#/SRC5	I/O, Dif	3.3V tolerant input for stopping PCI and SRC outputs./ 100 MHz Differential serial reference clocks.The option is selected by SRC5_EN
39	VDD_SRC	PWR	3.3V Power supply for SRC PLL.
40	SRC6#	O, DIF	100 MHz Differential serial reference clocks.
41	SRC6	O, DIF	100 MHz Differential serial reference clocks.
42	VSS_SRC	GND	Ground for outputs.
43	SRC7#	O, DIF	100 MHz Differential serial reference clocks
44	SRC7	O, DIF	00 MHz Differential serial reference clocks
45	VDD_SRC_IO	PWR	3.3V-1.05V power supply for SRC outputs.
46	SRC8#/CPUC2_ITP#	O, DIF	Selectable differential CPU or SRC clock output. ITP_EN = 0 @ CK_PWRGD assertion = SRC8 ITP_EN = 1 @ CK_PWRGD assertion = CPU2 <i>Note: CPU2 is an iAMT clock in iAMT mode depending on the configuration set in Byte 11 Bit3:2.</i>
47	SRC8/CPUT2_ITP	O, DIF	Selectable differential CPU or SRC clock output. ITP_EN = 0 @ CK_PWRGD assertion = SRC8 ITP_EN = 1 @ CK_PWRGD assertion = CPU2 <i>Note: CPU2 is an iAMT clock in iAMT mode depending on the configuration set in Byte 11 Bit3:2.</i>
48	SEL_24.576M	I, PD	Select 25M1_24.576M output and SRC1 0 = 25M1, M= SRC1, 1 = 24.576M
49	VDD_CPU_IO	PWR	3.3V-1.05V power supply for CPU outputs.
50	CPU1#	O, DIF	Differential CPU clock outputs. <i>Note: CPU1 is an iAMT clock in iAMT mode depending on the configuration set in Byte 11 Bit3:2.</i>
51	CPU1	O, DIF	Differential CPU clock outputs. <i>Note: CPU1 is an iAMT clock in iAMT mode depending on the configuration set in Byte 11 Bit3:2.</i>
52	VSS_CPU	GND	Ground for outputs.
53	CPU0#	O, DIF	Differential CPU clock outputs.
54	CPU0	O, DIF	Differential CPU clock outputs.
55	VDD_CPU	PWR	3.3V Power supply for CPU PLL.
56	CK_PWRGD/PWRDWN#	I	3.3V LVTTTL input. This pin is a level sensitive strobe used to latch the FS_A, FS_B, FS_C, and ITP_EN. After CK_PWRGD (active HIGH) assertion, this pin becomes a real-time input for asserting power down (active LOW).
57	FSB/TEST_MODE	I	3.3V tolerant input for CPU frequency selection. Selects Ref/N or Tri-state when in test mode 0 = Tri-state, 1 = Ref/N. <i>Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.</i>
58	VSS_REF	GND	Ground for outputs.
59	XTAL_OUT	O, SE	14.318 MHz Crystal output.
60	XTAL_IN	I	14.318 MHz Crystal input.
61	VDD_REF	PWR	3.3V Power supply for outputs and also maintains SMBUS registers during power-down.
62	REF0/FSC/TEST_SEL	I/O	3.3V tolerant input for CPU frequency selection/ fixed 14.318 clock output. Selects test mode if pulled to V _{IHFS_C} when CK_PWRGD is asserted HIGH. <i>Refer to DC Electrical Specifications table for V_{ILFS_C}, V_{IMFS_C}, V_{IHFS_C} specifications.</i>

64-TSSOP Pin Definitions

Pin No.	Name	Type	Description
63	SMB_DATA	I/O	SMBus compatible SDATA.
64	SMB_CLK	I	SMBus compatible SCLOCK.

Frequency Select Pin (FSA, FSB and FSC)

FSC	FSB	FSA	CPU	SRC	PCIF/PCI	REF	DOT96	USB
0	0	0	266 MHz	100 MHz	33 MHz	14.318 MHz	96 MHz	48 MHz
0	0	1	133 MHz					
0	1	0	200 MHz					
0	1	1	166 MHz					
1	0	0	333 MHz					
1	0	1	100 MHz					
1	1	0	400 MHz					
1	1	1	Reserved	Reserved				

Frequency Select Pin (FSA, FSB and FSC)

Apply the appropriate logic levels to FSA, FSB, and FSC inputs before CK-PWRGD assertion to achieve host clock frequency selection. When the clock chip sampled HIGH on CK-PWRGD and indicates that VTT voltage is stable then FSA, FSB, and FSC input values are sampled. This process employs a one-shot functionality and once the CK-PWRGD sampled a valid HIGH, all other FSA, FSB, FSC, and CK-PWRGD transitions are ignored except in test mode

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers are individually enabled or disabled. The registers associated with the Serial Data Interface initialize to their default setting at power-up. The use of this interface is

optional. Clock device register changes are normally made at system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, Access the bytes in sequential order from lowest to highest (most significant bit first) with the ability to stop after any complete byte is transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code described in *Table 1*.

The block write and block read protocol is outlined in *Table 2* while *Table 3* outlines byte write and byte read protocol. The slave receiver address is 11010010 (D2h)

Table 1. Command Code Definition

Bit	Description
7	0 = Block read or block write operation, 1 = Byte read or byte write operation
(6:0)	Byte offset for byte read or byte write operation. For block read or block write operations, these bits should be '0000000'

Table 2. Block Read and Block Write Protocol

Block Write Protocol		Block Read Protocol	
Bit	Description	Bit	Description
1	Start	1	Start
8:2	Slave address--7 bits	8:2	Slave address--7 bits
9	Write	9	Write
10	Acknowledge from slave	10	Acknowledge from slave
18:11	Command Code--8 bits	18:11	Command Code--8 bits
19	Acknowledge from slave	19	Acknowledge from slave
27:20	Byte Count--8 bits (Skip this step if I ² C_EN bit set)	20	Repeat start
28	Acknowledge from slave	27:21	Slave address--7 bits
36:29	Data byte 1--8 bits	28	Read = 1
37	Acknowledge from slave	29	Acknowledge from slave
45:38	Data byte 2--8 bits	37:30	Byte Count from slave--8 bits

Table 2. Block Read and Block Write Protocol (continued)

Block Write Protocol		Block Read Protocol	
Bit	Description	Bit	Description
46	Acknowledge from slave	38	Acknowledge
....	Data Byte /Slave Acknowledges	46:39	Data byte 1 from slave–8 bits
....	Data Byte N–8 bits	47	Acknowledge
....	Acknowledge from slave	55:48	Data byte 2 from slave–8 bits
....	Stop	56	Acknowledge
		Data bytes from slave / Acknowledge
		Data Byte N from slave–8 bits
		NOT Acknowledge
		Stop

Table 3. Byte Read and Byte Write Protocol

Byte Write Protocol		Byte Read Protocol	
Bit	Description	Bit	Description
1	Start	1	Start
8:2	Slave address–7 bits	8:2	Slave address–7 bits
9	Write	9	Write
10	Acknowledge from slave	10	Acknowledge from slave
18:11	Command Code–8 bits	18:11	Command Code–8 bits
19	Acknowledge from slave	19	Acknowledge from slave
27:20	Data byte–8 bits	20	Repeated start
28	Acknowledge from slave	27:21	Slave address–7 bits
29	Stop	28	Read
		29	Acknowledge from slave
		37:30	Data from slave–8 bits
		38	NOT Acknowledge
		39	Stop

**Control Registers****Byte 0: Control Register 0**

Bit	@Pup	Name	Description
7	HW	FS_C	CPU Frequency Select Bit, set by HW
6	HW	FS_B	CPU Frequency Select Bit, set by HW
5	HW	FS_A	CPU Frequency Select Bit, set by HW
4	0	iAMT_EN	Set via SMBus or by combination of PWRDWN, CPU_STP, and PCI_STP 0 = Legacy Mode, 1 = iAMT Enabled
3	0	Reserved	Reserved
2	0	Reserved	Reserved
1	0	SATA_SEL	Select source of SATA clock 0 = PLL3, 1 = PLL4
0	1	PD_Restore	Save Config. In powerdown 0 = Config. Cleared, 1 = Config. Saved

Byte 1: Control Register 1

Bit	@Pup	Name	Description
7	0	SRC0_SEL	Select for SRC0 or DOT96 0 = SRC0, 1 = DOT96
6	0	PLL1_SS_DC	Select for down or center SS 0 = Down spread, 1 = Center spread
5	0	PLL3_SS_DC	Select for down or center SS 0 = Down spread, 1 = Center spread
4	0	Reserved	Reserved
3	0	Reserved	Reserved
2	0	Reserved	Reserved
1	1	Reserved	Reserved
0	1	PCI_SEL	Select source of PCI clocks 0=PLL1, 1=PLL3

Byte 2: Control Register 2

Bit	@Pup	Name	Description
7	1	REF0_OE	Output enable for REF0 0 = Output Disabled, 1 = Output Enabled
6	1	USB48_OE	Output enable for USB48 0 = Output Disabled, 1 = Output Enabled
5	1	PCIF0_OE	Output enable for PCIF5 0 = Output Disabled, 1 = Output Enabled
4	1	PCI4_OE	Output enable for PCI4 0 = Output Disabled, 1 = Output Enabled
3	1	PCI3_OE	Output enable for PCI3 0 = Output Disabled, 1 = Output Enabled
2	1	PCI2_OE	Output enable for PCI2 0 = Output Disabled, 1 = Output Enabled
1	1	PCI1_OE	Output enable for PCI1 0 = Output Disabled, 1 = Output Enabled
0	1	PCI0_OE	Output enable for PCI0 0 = Output Disabled, 1 = Output Enabled

Byte 3: Control Register 3

Bit	@Pup	Name	Description
7	1	SRC11_OE	Output enable for SRC11 0 = Output Disabled, 1 = Output Enabled
6	1	SRC10_OE	Output enable for SRC10 0 = Output Disabled, 1 = Output Enabled
5	1	SRC9_OE	Output enable for SRC9 0 = Output Disabled, 1 = Output Enabled
4	1	SRC8/CPU2_ITP_OE	Output enable for SRC8 or CPU2_ITP 0 = Output Disabled, 1 = Output Enabled
3	1	SRC7_OE	Output enable for SRC7 0 = Output Disabled, 1 = Output Enabled
2	1	SRC6_OE	Output enable for SRC6 0 = Output Disabled, 1 = Output Enabled
1	1	RESERVED	RESERVED
0	1	SRC4_OE	Output enable for SRC4 0 = Output Disabled, 1 = Output Enabled

Byte 4: Control Register 4

Bit	@Pup	Name	Description
7	1	SRC3_OE	Output enable for SRC3 0 = Output Disabled, 1 = Output Enabled
6	1	SRC2/SATA_OE	Output enable for SRC2/SATA 0 = Output Disabled, 1 = Output Enabled
5	1	SRC1_OE	Output enable for SRC1 0 = Output Disabled, 1 = Output Enabled
4	1	SRC0/DOT96_OE	Output enable for SRC0/DOT96 0 = Output Disabled, 1 = Output Enabled
3	1	CPU1_OE	Output enable for CPU1 0 = Output Disabled, 1 = Output Enabled
2	1	CPU0_OE	Output enable for CPU0 0 = Output Disabled, 1 = Output Enabled
1	1	PLL1_SS_EN	Enable PLL1s spread modulation, 0 = Spread Disabled, 1 = Spread Enabled
0	1	PLL3_SS_EN	Enable PLL3s spread modulation 0 = Spread Disabled, 1 = Spread Enabled

Byte 5: Control Register 5

Bit	@Pup	Name	Description
7	0	CR#_A_EN	Enable CR#_A (clk req) 0 = Disabled, 1 = Enabled,
6	0	CR#_A_SEL	Set CR#_A → SRC0 or SRC2 0 = CR#_A→SRC0, 1 = CR#_A→SRC2
5	0	CR#_B_EN	Enable CR#_B (clk req) 0 = Disabled, 1 = Enabled,
4	0	CR#_B_SEL	Set CR#_B → SRC1 or SRC4 0 = CR#_B→SRC1, 1 = CR#_B→SRC4
3	0	CR#_C_EN	Enable CR#_C (clk req) 0 = Disabled, 1 = Enabled
2	0	CR#_C_SEL	Set CR#_C → SRC0 or SRC2 0 = CR#_C→SRC0, 1 = CR#_C→SRC2

Byte 5: Control Register 5 (continued)

Bit	@Pup	Name	Description
1	0	CR#_D_EN	Enable CR#_D (clk req) 0 = Disabled, 1 = Enabled
0	0	CR#_D_SEL	Set CR#_D → SRC1 or SRC4 0 = CR#_D→SRC1, 1 = CR#_D→SRC4

Byte 6: Control Register 6

Bit	@Pup	Name	Description
7	0	CR#_E_EN	Enable CR#_E (clk req) → SRC6 0 = Disabled, 1 = Enabled
6	0	CR#_F_EN	Enable CR#_F (clk req) → SRC8 0 = Disabled, 1 = Enabled
5	0	CR#_G_EN	Enable CR#_G (clk req) → SRC9 0 = Disabled, 1 = Enabled
4	0	CR#_H_EN	Enable CR#_H (clk req) → SRC10 0 = Disabled, 1 = Enabled
3	0	Reserved	Reserved
2	0	Reserved	Reserved
1	0	Reserved	Reserved
0	0	SRC_STP_CTRL	Allows control of SRC with assertion of PCI_STOP# 0 = Free running SRC 1 = Stopped with PCI_STOP#

Byte 7: Vendor ID

Bit	@Pup	Name	Description
7	0	Rev Code Bit 3	Revision Code Bit 3
6	0	Rev Code Bit 2	Revision Code Bit 2
5	0	Rev Code Bit 1	Revision Code Bit 1
4	1	Rev Code Bit 0	Revision Code Bit 0
3	1	Vendor ID bit 3	Vendor ID Bit 3
2	0	Vendor ID bit 2	Vendor ID Bit 2
1	0	Vendor ID bit 1	Vendor ID Bit 1
0	0	Vendor ID bit 0	Vendor ID Bit 0

Byte 8: Control Register 8

Bit	@Pup	Name	Description
7	0	Device_ID3	0000 = 56-TSSOP
6	0	Device_ID2	0001 = 64-TSSOP
5	0	Device_ID1	0010 = Reserved 0011 = 56-QFN
4	1	Device_ID0	0100 = 64-QFN 0101 = Reserved 0110 = Reserved 0111 = 56-SSOP 1000 = Reserved 1001 = Reserved 1010 = Reserved 1011 = Reserved 1100 = Reserved 1101 = Reserved 1110 = Reserved 1111 = Reserved

Byte 8: Control Register 8 (continued)

Bit	@Pup	Name	Description
3	0	Reserved	Reserved
2	0	Reserved	Reserved
1	1	25M0_F_OE	Output enable for 25M0_F 0 = Output Disabled, 1 = Output Enabled
0	1	25M1_24.576M_OE	Output enable for 25M1_24.576M 0 = Output Disabled, 1 = Output Enabled

Byte 9: Control Register 9

Bit	@Pup	Name	Description
7	0	PCIF5_STP_CTRL	Allows control of PCIF5 with assertion of PCI_STOP# 0 = Free running PCIF, 1 = Stopped with PCI_STOP#
6	0	Reserved	Reserved
5	1	REF Bit1	REF drive strength Setting 1 of 3 (see Byte 13 and 14 for more settings) 0 = Low, 1 = High
4	0	TEST_MODE_SEL	Test mode select either REF/N or tri-state 0 = All outputs tri-state, 1 = All output REF/N
3	0	TEST_MODE_ENTRY	Allows entry into test mode 0 = Normal Operation, 1 = Enter test mode(s)
2	1	12C_VOUT<2>	12C_VOUT[2:0]
1	0	12C_VOUT<1>	000 = 0.30V 001 = 0.40V
0	1	12C_VOUT<0>	010 = 0.50V 011 = 060V 100 = 0.70V 101 = 0.80V (default) 110 = 0.90V 111 = 1.00V

Byte 10: Control Register 10

Bit	@Pup	Name	Description
7	HW	SRC5_EN	SRC5_EN latch status 0= CPU_STOP#/PCI_STOP#; 1= SRC5
6	0	Reserved	Reserved
5	0	Reserved	Reserved
4	0	Reserved	Reserved
3	0	Reserved	Reserved
2	0	Reserved	Reserved
1	1	CPU1_STP_CTRL	Enable CPU_STOP# control of CPU1 0 = Free running, 1= Stoppable
0	1	CPU0_STP_CTRL	Enable CPU_STOP# control of CPU0 0 = Free running, 1= Stoppable

Byte 11: Control Register 11

Bit	@Pup	Name	Description
7	0	Reserved	Reserved
6	0	Reserved	Reserved
5	1	25M0_F	25M0_F Output Enabled applies to Powerdown / M1 0 = 25MHz disabled in Powerdown / M1 1 = 25MHz enabled in Powerdown / M1; Sticky 1

Table 4. Crystal Recommendations

Frequency (Fund)	Cut	Loading	Load Cap	Drive (max.)	Shunt Cap (max.)	Motional (max.)	Tolerance (max.)	Stability (max.)	Aging (max.)
14.31818 MHz	AT	Parallel	20 pF	0.1 mW	5 pF	0.016 pF	35 ppm	30 ppm	5 ppm

The SL28504 requires a Parallel Resonance Crystal. Substituting a series resonance crystal causes the SL28504 to operate at the wrong frequency and violates the ppm specification. For most applications there is a 300-ppm frequency shift between series and parallel crystals due to incorrect loading

crystal loading correctly. Again, the capacitance on each side is in series with the crystal. The total capacitance on both side is twice the specified crystal load capacitance (CL). Trim capacitors are calculated to provide equal capacitive loading on both sides.

Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, use the total capacitance the crystal sees to calculate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using the two trim capacitors. It is important that the trim capacitors are in series with the crystal. It is not true that load capacitors are in parallel with the crystal and are approximately equal to the load capacitance of the crystal.

Figure 1. Crystal Capacitive Clarification

Calculating Load Capacitors

In addition to the standard external trim capacitors, consider the trace capacitance and pin capacitance to calculate the

Figure 2. Crystal Loading Example

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$C_e = 2 * CL - (C_s + C_i)$$

Total Capacitance (as seen by the crystal)

$$CL_e = \frac{1}{\left(\frac{1}{C_{e1} + C_{s1} + C_{i1}} + \frac{1}{C_{e2} + C_{s2} + C_{i2}} \right)}$$

CL	Crystal load capacitance
CLe	Actual loading seen by crystal using standard value trim capacitors
Ce	External trim capacitors
Cs	Stray capacitance (terraced)
Ci	Internal capacitance (lead frame, bond wires, etc.)

Dial-A-Frequency® (CPU and PCIEX)

This feature allows the user to over-clock their system by slowly stepping up the CPU or SRC frequency. When the programmable output frequency feature is enabled, the CPU and SRC frequencies are determined by the following equation:

$$F_{cpu} = G * N/M \text{ or } F_{cpu} = G2 * N, \text{ where } G2 = G / M.$$

- “N” and “M” are the values programmed in Programmable Frequency Select N-Value Register and M-Value Register, respectively.
- “G” stands for the PLL Gear Constant, which is determined by the programmed value of FS[E:A]. See *Table , Frequency Select Table* for the Gear Constant for each Frequency selection. The PCI Express only allows user control of the N register, the M value is fixed and documented in *Table , Frequency Select Table*.

In this mode, the user writes the desired N and M values into the DAF I2C registers. The user cannot change only the M value and must change both the M and the N values at the same time, if they require a change to the M value. The user may change only the N value.

Associated Register Bits

- *CPU_DAF Enable* – This bit enables CPU DAF mode. By default, it is not set. When set, the operating frequency is determined by the values entered into the CPU_DAF_N register. Note that the CPU_DAF_N and M register must contain valid values before CPU_DAF is set. Default = 0, (No DAF).
- *CPU_DAF_N* – There are nine bits (for 512 values) to linearly change the CPU frequency (limited by VCO range). Default = 0, (0000). The allowable values for N are detailed in *Table , Frequency Select Table*.
- *CPU_DAF M* – There are 7 bits (for 128 values) to linearly change the CPU frequency (limited by VCO range). Default = 0, the allowable values for M are detailed in *Table , Frequency Select Table*
- *SRC_DAF Enable* – This bit enables SRC DAF mode. By default, it is not set. When set, the operating frequency is determined by the values entered into the SRC_DAF_N register. Note that the SRC_DAF_N register must contain valid values before SRC_DAF is set. Default = 0, (No DAF).
- *SRC_DAF_N* – There are nine bits (for 512 values) to linearly change the CPU frequency (limited by VCO range). Default = 0, (0000). The allowable values for N are detailed in *Table , Frequency Select Table*.

Smooth Switching

The device contains one smooth switch circuit that is shared by the CPU PLL and SRC PLL. The smooth switch circuit ensures that when the output frequency changes by overclocking, the transition from the old frequency to the new frequency is a slow, smooth transition containing no glitches. The rate of change of output frequency when using the smooth switch circuit is less than 1 MHz/0.667 μs. The frequency overshoot and undershoot is less than 2%.

The Smooth Switch circuit assigns auto or manual. In Auto mode, clock generator assigns smooth switch automatically when the PLL does overclocking. For manual mode, assign the smooth switch circuit to PLL via Smbus. By default the smooth switch circuit is set to auto mode. PLL can be over-clocked when it does not have control of the smooth switch circuit but it is not guaranteed to transition to the new frequency without large frequency glitches.

Do not enable over-clocking and change the N values of both PLLs in the same SMBUS block write and use smooth switch mechanism on spread spectrum on/off.

PD_RESTORE

If a ‘0’ is set for Byte 0 bit 0 then, upon assertion of PWRDWN# LOW, the SL28504 initiates a full reset. The result of this is that the clock chip emulates a cold power on start and goes to the “Latches Open” state. If the PD_RESTORE bit is set to a ‘1’ then the configuration is stored upon PWRDWN# asserted LOW. Note that if the iAMT bit, Byte 0 bit 3, is set to a ‘1’ then the PD_RESTORE bit must be ignored. In other words, in Intel iAMT mode, PWRDWN# reset is not allowed.

PWRDWN# (Power down) Clarification

The CKPWRGD/PWRDWN# pin is a dual-function pin. During initial power up, the pin functions as CKPWRGD. Once CKPWRGD has been sampled HIGH by the clock chip, the pin assumes PD# functionality. The PD# pin is an asynchronous active LOW input used to shut off all clocks cleanly before shutting off power to the device. This signal is synchronized internally to the device before powering down the clock synthesizer. PD# is also an asynchronous input for powering up the system. When PD# is asserted LOW, clocks are driven to a LOW value and held before turning off the VCOs and the crystal oscillator.

PWRDWN# (Power down) Assertion

When PD is sampled HIGH by two consecutive rising edges of CPUC, all single-ended outputs will be held LOW on their next HIGH-to-LOW transition and differential clocks must held LOW. When PD mode is desired as the initial power on state, PD must be asserted HIGH in less than 10 μs after asserting CKPWRGD.

PWRDWN# Deassertion

The power up latency is less than 1.8 ms. This is the time from the deassertion of the PD# pin or the ramping of the power supply until the time that stable clocks are generated from the clock chip. All differential outputs stopped in a three-state condition, resulting from power down are driven high in less than 300 μs of PD# deassertion to a voltage greater than 200 mV. After the clock chip’s internal PLL is powered up and locked, all outputs are enabled within a few clock cycles of

each clock. *Figure 4* is an example showing the relationship of clocks coming up.

Figure 3. Power down Assertion Timing Waveform

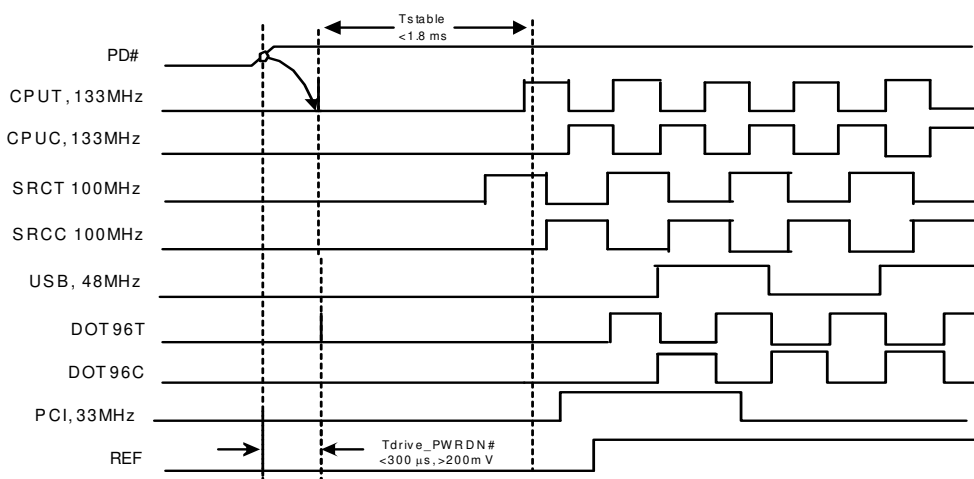

Figure 4. Power down Deassertion Timing Waveform

Figure 5. CK_PWRGD Timing Diagram

CPU_STP# Assertion

The CPU_STP# signal is an active LOW input used for synchronous stopping and starting the CPU output clocks while the rest of the clock generator continues to function. When the CPU_STP# pin is asserted, all CPU outputs that are set with the SMBus configuration to be stoppable are stopped within two to six CPU clock periods after sampled by two rising edges of the internal CPUC clock. The final states of the stopped CPU signals are CPUT = HIGH and CPUC = LOW.

CPU_STP# Deassertion

The deassertion of the CPU_STP# signal causes all stopped CPU outputs to resume normal operation in a synchronous manner. No short or stretched clock pulses are produced when the clock resumes. The maximum latency from the deassertion to active outputs is no more than two CPU clock cycles.

Figure 6. CPU_STP# Assertion Waveform

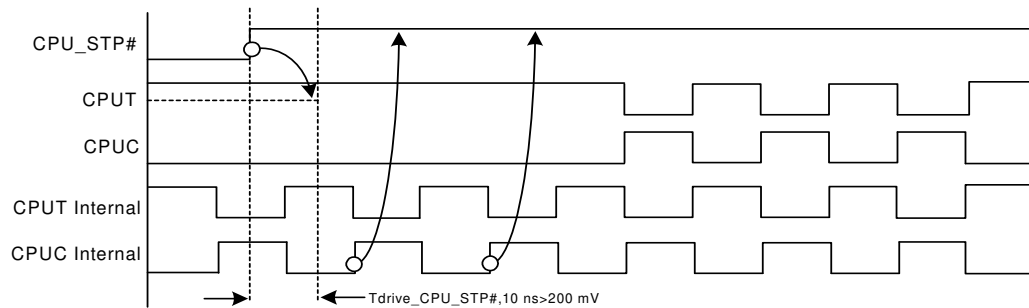

Figure 7. CPU_STP# Deassertion Waveform

Figure 8. CPU_STOP# = Driven, CPU_PD = Driven, DOT_PD = Driven

Figure 9. CPU_STP# = Tri-state, CPU_PD = Tri-state, DOT_PD = Tri-state

PCI_STP# Assertion

The PCI_STP# signal is an active LOW input used for synchronously stopping and starting the PCI outputs while the rest of the clock generator continues to function. The set-up time for capturing PCI_STP# going LOW is 10 ns (t_{SU}). (See Figure 10.) The PCIF clocks are affected by this pin if their corresponding control bit in the SMBus register is set to allow them to be free running.

Figure 10. PCI_STP# Assertion Waveform

PCI_STP# Deassertion

The deassertion of the PCI_STP# signal causes all PCI and stoppable PCIF clocks to resume running in a synchronous manner within two PCI clock periods, after PCI_STP# transitions to a HIGH level.

Figure 11. PCI_STP# Deassertion Waveform

Table 5. Output Driver Status during PCI-STOP# and CPU-STOP#

		PCI_STOP# Asserted	CPU_STOP# Asserted	SMBus OE Disabled
Single-ended Clocks	Stoppable	Driven low	Running	Driven low
	Non stoppable	Running	Running	
Differential Clocks	Stoppable	Clock driven high	Clock driven high	Clock driven Low or 20K pulldown
		Clock# driven low	Clock# driven low	
	Non stoppable	Running	Running	

Table 6. Output Driver Status

	All Single-ended Clocks		All Differential Clocks except CPU1		CPU1	
	w/o Strap	w/ Strap	Clock	Clock#	Clock	Clock#
Latches Open State	Low	Hi-z	Low or 20K pulldown	Low	Low or 20K pulldown	Low
Powerdown	Low	Hi-z	Low or 20K pulldown	Low	Low or 20K pulldown	Low
M1	Low	Hi-z	Low or 20K pulldown	Low	Running	Running

T _{DC}	DOT96 Duty Cycle	Measured at 0V differential	45	55	%
T _{PERIOD}	DOT96 Period	Measured at 0V differential at 0.1s	10.4156	10.4177	ns
T _{PERIODAbs}	DOT96 Absolute Period	Measured at 0V differential at 0.1s	10.1656	10.6677	ns
T _{CCJ}	DOT96 Cycle to Cycle Jitter	Measured at 0V differential at 1 clock	–	250	ps
L _{ACC}	DOT96 Long Term Accuracy	Measured at 0V differential at 1 clock	–	100	ppm
T _R / T _F	DOT96 Rising/Falling Slew Rate	Measured differentially from ±150 mV	2.5	8	V/ns
T _{RFM}	Rise/Fall Matching	Measured single-endedly from ±75 mV	–	20	%
V _{HIGH}	Voltage High			1.15	V
V _{LOW}	Voltage Low		–0.3	–	V
V _{OX}	Crossing Point Voltage at 0.7V Swing		300	550	mV
T _{RFM}	Rise/Fall Matching	Measured single-endedly from ±75 mV	–	20	%
V _{HIGH}	Voltage High			1.15	V
V _{LOW}	Voltage Low		–0.3	–	V
V _{OX}	Crossing Point Voltage at 0.7V Swing		300	550	mV
PCI/PCIF at 3.3V
