Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Intelligent 256-Byte EEPROM with Write Protect Function   SLE 4432

Intelligent 256-Byte EEPROM with Write Protect Function   SLE 4442
and Programmable Security Code (PSC)

Features

- 256 × 8-bit EEPROM organization
- Byte-wise addressing
- Irreversible byte-wise write protection of lowest 32 addresses (Byte 0 ... 31)
- 32 × 1-bit organization of protection memory
- Two-wire link protocol
- End of processing indicated at data output
- Answer-to-Reset acc. to ISO standard 7816-3
- Programming time 2.5 ms per byte for both erasing and writing
- Minimum of 10^4 write/erase cycles[1]
- Data retention for minimum of ten years[1]
- Contact configuration and serial interface in accordance with ISO standard 7816 (synchronous transmission)

C1

M2.2
Additional Feature of SLE 4442

- Data can only be changed after entry of the correct 3-byte programmable security code (security memory)

Type	Ordering Code	Package
SLE 4432 M2.2	on request	Wire-Bonded Module M2.2

Pin Definitions and Functions

Card Contact	Symbol	Function
C1	VCC	Supply voltage
C2	RST	Reset
C3	CLK	Clock input
C4	N.C.	Not connected
C5	GND	Ground
C6	N.C.	Not connected
C7	I/O	Bidirectional data line (open drain)
C8	N.C.	Not connected

SLE 4432/SLE 4442 comes as a M2.2 wire-bonded module for embedding in plastic cards or as a die for customer packaging.

2 Functional Description

Block Diagram
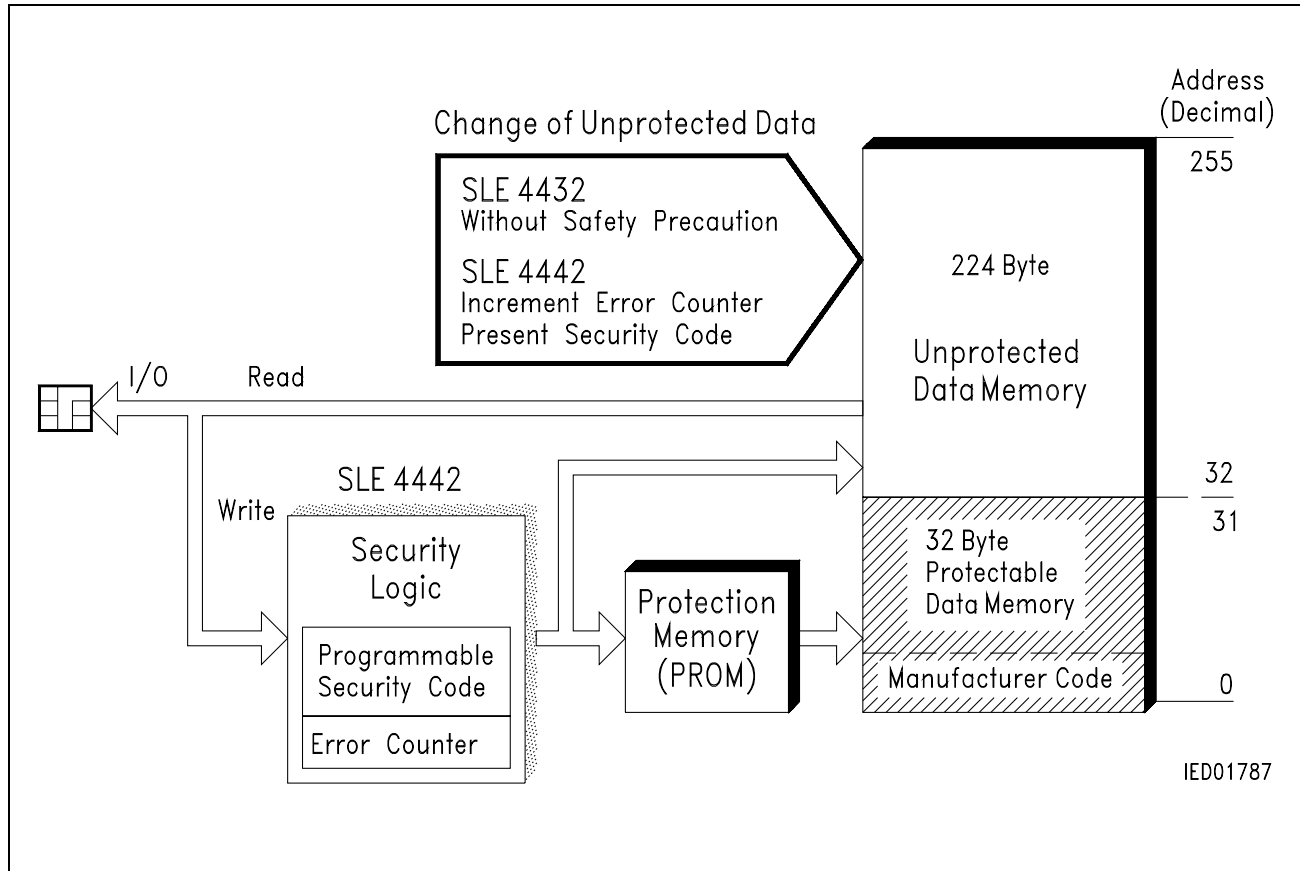

SIEMENS
2.1   Memory Overview

Figure 1
Memory Overwiew

SLE 4432

The SLE 4432 consists of 256 x 8 bit EEPROM main memory and a 32-bit protection memory with PROM functionality. The main memory is erased and written byte by byte. When erased, all 8 bits of a data byte are set to logical one. When written, the information in the individual EEPROM cells is, according to the input data, altered bit by bit to logical zeros (logical AND between the old and the new data in the EEPROM). Normally a data change consists of an erase and write procedure. It depends on the contents of the data byte in the main memory and the new data byte whether the EEPROM is really erased and/or written. If none of the 8 bits in the addressed byte requires a zero-to-one transition the erase access will be suppressed. Vice versa the write access will be suppressed if no one-to-zero transition is necessary. The write and the erase operation takes at least 2.5 ms each.

Each of the first 32 bytes can be irreversibly protected against data change by writing the corresponding bit in the protection memory. Each data byte in this address range is assigned to one bit of the protection memory and has the same address as the data byte in the main memory which it is assigned to. Once written the protection bit cannot be erased (PROM).
SLE 4442

Additionally to the above functions the SLE 4442 provides a security code logic which controls the write/erase access to the memory. For this purpose the SLE 4442 contains a 4-byte security memory with an **E**rror **C**ounter EC (bit 0 to bit 2) and 3 bytes reference data. These 3 bytes as a whole are called **P**rogrammable **S**ecurity **C**ode (PSC). After power on the whole memory, except for the reference data, can only be read. Only after a successful comparison of verification data with the internal reference data the memory has the identical access functionality of the SLE 4432 until the power is switched off. After three successive unsuccessful comparisons the **E**rror **C**ounter blocks any subsequent attempt, and hence any possibility to write and erase.

2.2   Transmission Protocol

The transmission protocol is a two wire link protocol between the interface device IFD and the integrated circuit IC. It is identical to the protocol type "S = A". All data changes on I/O are initiated by the falling edge on CLK.

The transmission protocol consists of the 4 modes:

- Reset and Answer-to-Reset
- Command Mode
- Outgoing Data Mode   } Operational modes
- Processing Mode

Note: The I/O pin is open drain and therefore requires an external pull up resistor to achieve a high level.

2.2.1 Reset and Answer-to-Reset

Answer-to-Reset takes place according to ISO standard 7816-3 (ATR). The reset can be given at any time during operation. In the beginning, the address counter is set to zero together with a clock pulse and the first data bit (LSB) is output to I/O when RST is set from level H to level L. Under a continuous input of additional 31 clock pulses the contents of the first 4 EEPROM addresses is read out. The 33rd clock pulse switches I/O to high impedance Z and finishes the ATR procedure.

Answer-to-Reset (Hex)	Byte 1	Byte 2	Byte 3	Byte 4
	$DO_7 … DO_0$	$DO_{15} … DO_8$	$DO_{23} … DO_{16}$	$DO_{31} … DO_{24}$
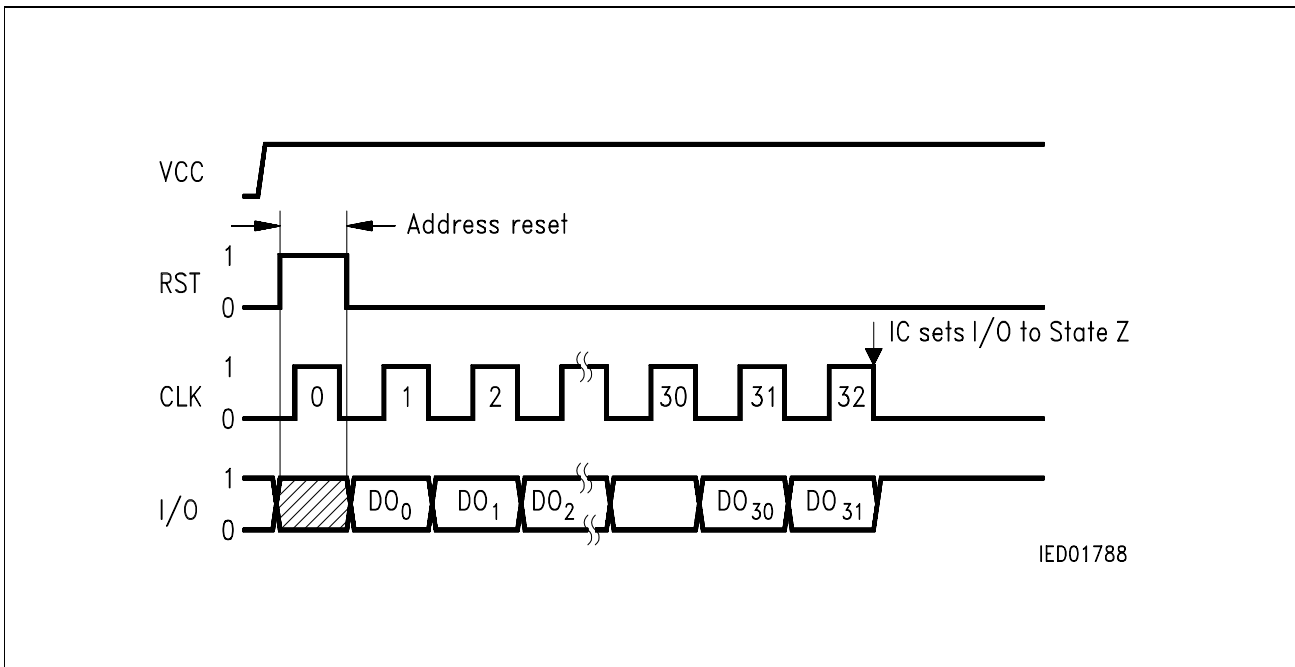

Figure 2
Reset and Answer-to-Reset

2.2.2 Operational Modes

Command Mode

After the Answer-to-Reset the chip waits for a command. Every command begins with a start condition, includes a 3 bytes long command entry followed by an additional clock pulse and ends with a stop condition.

– Start condition: Falling edge on I/O during CLK in level H
– Stop condition: Rising edge on I/O during CLK in level H

After the reception of a command there are two possible modes:

– Outgoing data mode for reading
– Processing mode for writing and erasing

Outgoing Data Mode

In this mode the IC sends data to the IFD. The first bit becomes valid on I/O after the first falling edge on CLK. After the last data bit an additional clock pulse is necessary in order to set I/O to high impedance Z and to prepare the IC for a new command entry. During this mode any start and stop condition is discarded.

Processing Mode

In this mode the IC processes internally. The IC has to be clocked continuously until I/O, which was switched to level L after the first falling edge of CLK, is set to high impedance level Z. Any start and stop condition is discarded during this mode.

Note: The RST line is low during the modes mentioned above. If RST is set to high during the CLK low level any operation is aborted and I/O is switched to high impedance Z (Break).
Figure 3
Operational Modes

2.3   Commands

Command Format

Each command consists of three bytes:

MSB		Control					LSB	MSB		Address					LSB	MSB		Data					LSB
B7	B6	B5	B4	B3	B2	B1	B0	A7	A6	A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0

Beginning with the control byte LSB is transmitted first.

Figure 4
Command Mode

The SLE 4432 provides 4 commands which are listed in **table 1**. Additionally to these commands the SLE 4442 provides 3 commands which can be found in **table 2**.

Table 1

| Byte 1 Control								Byte 2 Address	Byte 3 Data	Operation	Mode
B7	**B6**	**B5**	**B4**	**B3**	**B2**	**B1**	**B0**	**A7-A0**	**D7-D0**		
0	0	1	1	0	0	0	0	address	no effect	READ MAIN MEMORY	outgoing data
0	0	1	1	1	0	0	0	address	input data	UPDATE MAIN MEMORY	processing
0	0	1	1	0	1	0	0	no effect	no effect	READ PROTECTION MEMORY	outgoing data
0	0	1	1	1	1	0	0	address	input data	WRITE PROTECTION MEMORY	processing

Table 2
SLE 4442 only

0	0	1	1	0	0	0	1	no effect	no effect	READ SECURITY MEMORY	outgoing data
0	0	1	1	1	0	0	1	address	input data	UPDATE SECURITY MEMORY	processing
0	0	1	1	0	0	1	1	address	input data	COMPARE VERIFICATION DATA	processing

2.3.1 Read Main Memory (SLE 4432 and SLE 4442)

The command reads out the contents of the main memory (with LSB first) starting at the given byte address (N = 0…255) up to the end of the memory. After the command entry the IFD has to supply sufficient clock pulses. The number of clocks is m = (256 – N) × 8 + 1. The read access to the main memory is always possible.

Address (decimal)	Main Memory	Protection Memory	Security Memory (only SLE 4442)
255	Data Byte 255 (D7 … D0)	–	–
:	:	–	–
32	Data Byte 32 (D7 … D0)	–	–
31	Data Byte 31 (D7 … D0)	Protection Bit 31 (D31)	–
:	:	:	–
3	Data Byte 3 (D7 … D0)	Protection Bit 3 (D3)	Reference Data Byte 3 (D7 … D0)
2	Data Byte 2 (D7 … D0)	Protection Bit 2 (D2)	Reference Data Byte 2 (D7 … D0)
1	Data Byte 1 (D7 … D0)	Protection Bit 1 (D1)	Reference Data Byte 1 (D7 … D0)
0	Data Byte 0 (D7 … D0)	Protection Bit 0 (D0)	Error Counter

Command: READ MAIN MEMORY

	Control								Address	Data
	B7	B6	B5	B4	B3	B2	B1	B0	A7…A0	D7…D0
Binary	0	0	1	1	0	0	0	0	Address	No effect
Hexadecimal	30_H								$00_H…FF_H$	No effect

**Figure 5**
Read Main Memory

2.3.2 Read Protection Memory (SLE 4432 and SLE 4442)

The command transfers the protection bits under a continuous input of 32 clock pulses to the output. I/O is switched to high impedance Z by an additional pulse. The protection memory can always be read, and indicates the data bytes of the main memory protected against changing.

Address (decimal)	Main Memory	Protection Memory	Security Memory (only SLE 4442)
255	Data Byte 255 (D7 … D0)	–	–
:	:	–	–
32	Data Byte 32 (D7 … D0)	–	–
31	Data Byte 31 (D7 … D0)	Protection Bit 31 (D31)	–
:	:	:	–
3	Data Byte 3 (D7 … D0)	Protection Bit 3 (D3)	Reference Data Byte 3 (D7 … D0)
2	Data Byte 2 (D7 … D0)	Protection Bit 2 (D2)	Reference Data Byte 2 (D7 … D0)
1	Data Byte 1 (D7 … D0)	Protection Bit 1 (D1)	Reference Data Byte 1 (D7 … D0)
0	Data Byte 0 (D7 … D0)	Protection Bit 0 (D0)	Error Counter

Command: READ PROTECTION MEMORY

	Control								Address	Data
	B7	B6	B5	B4	B3	B2	B1	B0	A7…A0	D7…D0
Binary	0	0	1	1	0	1	0	0	No effect	No effect
Hexadecimal	34$_H$								No effect	No effect

Figure 6
Read Protection Memory

2.3.3 Update Main Memory (SLE 4432 and SLE 4442)

The command programs the addressed EEPROM byte with the data byte transmitted. Depending on the old and new data, one of the following sequences will take place during the processing mode:

- erase and write   (5 ms)   corresponding to m = 255 clock pulses
- write without erase   (2.5 ms)   corresponding to m = 124 clock pulses
- erase without write   (2.5 ms)   corresponding to m = 124 clock pulses

(All values at 50 kHz clock rate.)

Address (decimal)	Main Memory	Protection Memory	Security Memory (only SLE 4442)
255	Data Byte 255 (D7 … D0)	–	–
:	:	–	–
32	Data Byte 32 (D7 … D0)	–	–
31	Data Byte 31 (D7 … D0)	Protection Bit 31 (D31)	–
:	:	:	–
3	Data Byte 3 (D7 … D0)	Protection Bit 3 (D3)	Reference Data Byte 3 (D7 … D0)
2	Data Byte 2 (D7 … D0)	Protection Bit 2 (D2)	Reference Data Byte 2 (D7 … D0)
1	Data Byte 1 (D7 … D0)	Protection Bit 1 (D1)	Reference Data Byte 1 (D7 … D0)
0	Data Byte 0 (D7 … D0)	Protection Bit 0 (D0)	Error Counter

Command: UPDATE MAIN MEMORY

|	Control								Address	Data
	B7	B6	B5	B4	B3	B2	B1	B0	A7…A0	D7…D0
Binary	0	0	1	1	1	0	0	0	Address	Input data
Hexadecimal	38_H								$00_H…FF_H$	Input data

Figure 7
Erase and Write Main Memory

Figure 8
Erase or Write Main Memory

If the addressed byte is protected against changes (indicated by the associated written protection bit) the I/O is set to high impedance after the clock number 2 of the processing.

2.3.4 Write Protection Memory (SLE 4432 and SLE 4442)

The execution of this command contains a comparison of the entered data byte with the assigned byte in the EEPROM. In case of identity the protection bit is written thus making the data information unchangeable. If the data comparison results in data differences writing of the protection bit will be suppressed. Execution times and required clock pulses see UPDATE MAIN MEMORY.

Address (decimal)	Main Memory	Protection Memory	Security Memory (only SLE 4442)
255	Data Byte 255 (D7 … D0)	–	–
:	:	–	–
32	Data Byte 32 (D7 … D0)	–	–
31	Data Byte 31 (D7 … D0)	Protection Bit 31 (D31)	–
:	:	:	–
3	Data Byte 3 (D7 … D0)	Protection Bit 3 (D3)	Reference Data Byte 3 (D7 … D0)
2	Data Byte 2 (D7 … D0)	Protection Bit 2 (D2)	Reference Data Byte 2 (D7 … D0)
1	Data Byte 1 (D7 … D0)	Protection Bit 1 (D1)	Reference Data Byte 1 (D7 … D0)
0	Data Byte 0 (D7 … D0)	Protection Bit 0 (D0)	Error Counter

Command: WRITE PROTECTION MEMORY

	Control								Address	Data
	B7	B6	B5	B4	B3	B2	B1	B0	A7…A0	D7…D0
Binary	0	0	1	1	1	1	0	0	Address	Input data
Hexadecimal	$3C_H$								$00_H…1F_H$	Input data

2.3.5 Read Security Memory (SLE 4442 only)

Similar to the read command for the protection memory this command reads out the 4 bytes of the security memory. The number of clock pulses during the outgoing data mode is 32. I/O is switched to high impedance Z by an additional pulse. Without a preceeding successful verification of the PSC the output of the reference bytes is suppressed, that means I/O outputs state L for the reference data bytes.

Address (decimal)	Main Memory	Protection Memory	Security Memory (only SLE 4442)
255	Data Byte 255 (D7 … D0)	–	–
:	:	–	–
32	Data Byte 32 (D7 … D0)	–	–
31	Data Byte 31 (D7 … D0)	Protection Bit 31 (D31)	–
:	:	:	–
3	Data Byte 3 (D7 … D0)	Protection Bit 3 (D3)	Reference Data Byte 3(D7 … D0)
2	Data Byte 2 (D7 … D0)	Protection Bit 2 (D2)	Reference Data Byte 2(D7 … D0)
1	Data Byte 1 (D7 … D0)	Protection Bit 1 (D1)	Reference Data Byte 1(D7 … D0)
0	Data Byte 0 (D7 … D0)	Protection Bit 0 (D0)	Error Counter (0,0,0,0,0,D2,D1,D0)

Command: READ SECURITY MEMORY

|	Control								Address	Data
	B7	B6	B5	B4	B3	B2	B1	B0	A7…A0	D7…D0
Binary	0	0	1	1	0	0	0	1	No effect	No effect
Hexadecimal	31_H								No effect	No effect

Figure 9
Read Security Memory

2.3.6 Update Security Memory (SLE 4442 only)

Regarding the reference data bytes this command will only be executed if a PSC has been successfully verified before. Otherwise only each bit of the error counter (Address 0) can be written from "1" to "0". The execution times and the required clock pulses are the same as described under UPDATE MAIN MEMORY.

Command: UPDATE SECURITY MEMORY

	Control								**Address**	**Data**
	B7	B6	B5	B4	B3	B2	B1	B0	A7…A0	D7…D0
Binary	0	0	1	1	1	0	0	1	Address	Input data
Hexadecimal	39_H								$00_H…03_H$	Input data

2.3.7 Compare Verification Data (SLE 4442 only)

This command can only be executed in combination with an update procedure of the error counter (see PSC verification). The command compares one byte of the entered verification data byte with the corresponding reference data byte. For this procedure clock pulses are necessary during the processing mode.

Command: COMPARE VERIFICATION DATA

|	**Control**								**Address**	**Data**
	B7	B6	B5	B4	B3	B2	B1	B0	A7…A0	D7…D0
Binary	0	0	1	1	0	0	1	1	Address	Input data
Hexadecimal	33_H								$00_H…03_H$	Input data

Figure 10
Compare Verification Data

2.4 PSC Verification (SLE 4442 only)

The SLE 4442 requires a correct verification of the Programmable Security Code PSC stored in the Security Memory for altering data if desired.

The following procedure has to be carried out exactly as described. Any variation leads to a failure, so that a write/erase access will not be achieved. As long as the procedure has not been successfully concluded the error counter bits can only be changed from "1" to "0" but not erased.

At first an error counter bit has to be written to "0" by an UPDATE command (**see figure 11**) followed by three COMPARE VERIFICATION DATA commands beginning with byte 1 of the reference data. A successful conclusion of the whole procedure can be recognized by being able to erase the error counter which is not automatically erased. Now write/erase access to all memory areas is possible as long as the operating voltage is applied. In case of error the whole procedure can be repeated as long as erased counter bits are available. Having been enabled, the reference data are allowed to be altered like any other information in the EEPROM.

The following table gives an overview of the necessary commands for the PSC verification. The sequence of the shaded commands is mandatory.

Command	Control	Address	Data	Remark
	B7…B0	**A7…A0**	**D7…D0**	
Read security Memory	31_H	No effect	No effect	Check Error Counter
Update Security Memory	39_H	00_H	Input data	Write free bit in Error Counter input data: 0000 0ddd binary
Compare Verification Data	33_H	01_H	Input data	Reference Data Byte 1
Compare Verification Data	33_H	02_H	Input data	Reference Data Byte 2
Compare Verification Data	33_H	03_H	Input data	Reference Data Byte 3
Update Security Memory	39_H	00_H	FF_H	Erase Error Counter
Read Security Memory	31_H	No effect	No effect	Check Error Counter

As shipped, the PSC is programmed with a code according to individual agreement with the customer. Thus, knowledge of this code is indispensable to alter data.
Figure 11
Verification Procedure

2.5 Reset Modes

Reset and Answer-to-Reset (compare 2.2.1)

Power on Reset

After connecting the operating voltage to VCC, I/O is high impedance Z. By all means, a read access to any address or an Answer-to-Reset must be carried out before data can be altered.

2.6 Break

If RST is set to high during CLK in state L any operation is aborted and I/O is switched to high impedance Z. Minimum duration of t_{RES} = 5 µs is necessary to trigger a defined valid reset. After Break the chip is ready for further operations.

2.7 Failures

Behavior in case of failures:

In case of one of the following failures, the chip sets the I/O to high impedance Z after 8 clock pulses at the latest.

Possible failures:

- Comparison unsuccessful
- Wrong command
- Wrong number of command clock pulses
- Write/erase access to already protected bytes
- Rewriting and erasing of a bit in the protection memory

2.8 Coding of the Chip

Due to security purposes every chip is irreversibly coded by a scheme. By this way fraud and misuse is excluded. The relevant data are programmed in the memory area from address 0 to 31. Afterwards the associated protection bits are programmed. As an example, **figures 12** and **13** show ATR and Directory Data of Structure 1. When delivered, ATR header, ICM and ICT are programmed. Siemens programs also the AID. The AID (Application IDentifier) consists of 5 byte RID (Registered application provider IDentifier) administered by a national registration authority and of up to 11 byte PIX (Proprietary application Identifier eXtension). There are two possibilities: the customers AID or Siemens AID (only for sample quantities). Depending on the agreement between the customer and Siemens ICCF can be also programmed before delivery.
