

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

EFR32MG13 2.4 GHz 10 dBm Radio Board BRD4159A Reference Manual

The BRD4159A Mighty Gecko Radio Board enables developers to develop Zigbee®, Thread, Bluetooth® low energy and proprietary wireless applications. The board contains a 2.4 GHz Mighty Gecko Wireless System on Chip and is optimized for operating at 10 dBm output power. Radiated and conducted testing is supported with the on-board printed antenna and UFL connector.

The BRD4159A Mighty Gecko Radio Board plugs into the Wireless Starter Kit Main-board, which is provided with the Mighty Gecko Starter Kit and gives access to display, buttons and additional features from Expansion Boards. With the supporting Simplicity Studio suite of tools, developers can take advantage of graphical wireless application development; mesh networking debug and packet trace; and visual energy profiling and optimization. The board also serves as an RF reference design for applications targeting 2.4 GHz wireless operation with 10 dBm output power.

This document contains brief introduction and description of the BRD4159A Radio Board features focusing on the RF sections and performance.

RADIO BOARD FEATURES

- Wireless SoC: EFR32MG13P632F512GM48
- CPU core: ARM Cortex®-M4 with FPU
- Flash memory: 512 kB
- RAM: 64 kB
- Operation frequency: 2.4 GHz
- Transmit power: 10 dBm
- Integrated PCB antenna, UFL connector (optional).
- Crystals for LFXO and HFXO: 32.768 kHz and 38.4 MHz.

1. Introduction

The EFR32 Mighty Gecko Radio Boards provide a development platform (together with the Wireless Starter Kit Mainboard) for the Silicon Labs EFR32 Mighty Gecko Wireless System on Chips and serve as reference designs for the matching network of the RF interface.

The BRD4159A Radio Board is designed to operate in the 2400-2483.5 MHz band with the RF matching network optimized for operating at 10 dBm output power.

To develop and/or evaluate the EFR32 Mighty Gecko, the BRD4159A Radio Board can be connected to the Wireless Starter Kit Mainboard to get access to display, buttons and additional features from Expansion Boards and also to evaluate the performance of the RF interface.

2. Radio Board Connector

2.1 Introduction

The board-to-board connector scheme allows access to all EFR32MG13 GPIO pins as well as the RESETn signal. For more information on the functions of the available pins, see the EFR32MG13 data sheet.

2.2 Radio Board Connector Pin Associations

The figure below shows the mapping between the connector and the EFR32MG13 pins and their function on the Wireless Starter Kit Mainboard.

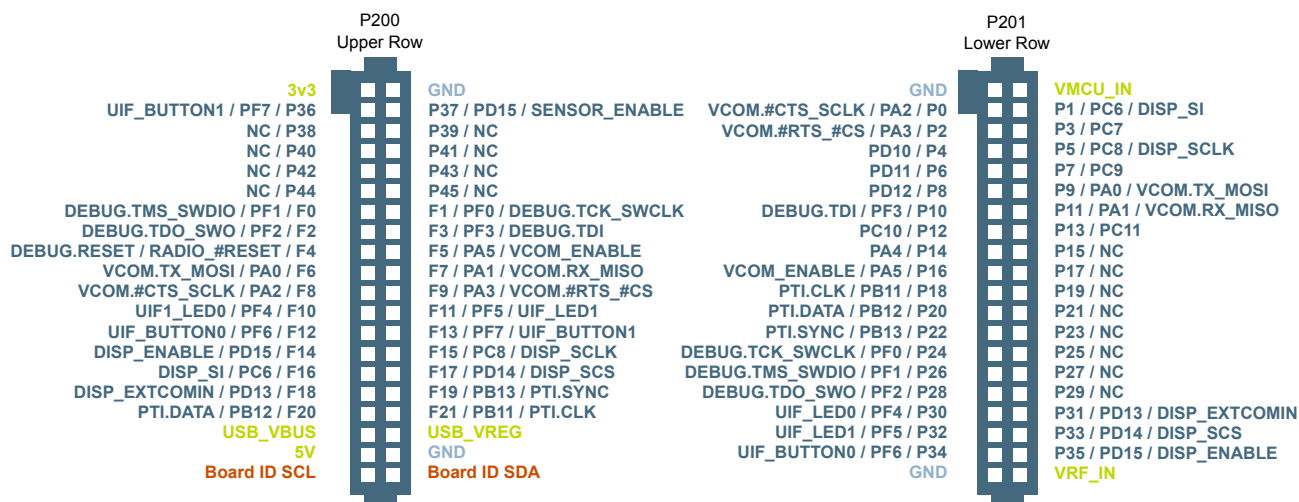

Figure 2.1. BRD4159A Radio Board Connector Pin Mapping

3. Radio Board Block Summary

3.1 Introduction

This section gives a short introduction to the blocks of the BRD4159A Radio Board.

3.2 Radio Board Block Diagram

The block diagram of the BRD4159A Radio Board is shown in the figure below.

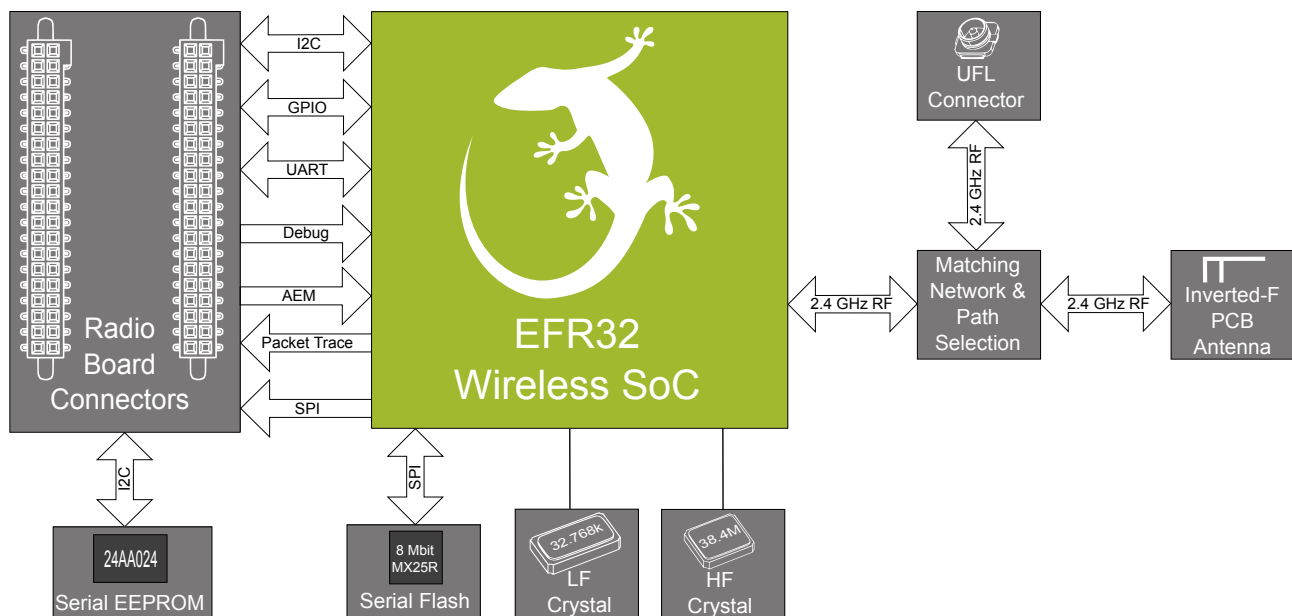

Figure 3.1. BRD4159A Block Diagram

3.3 Radio Board Block Description

3.3.1 Wireless MCU

The BRD4159A Mighty Gecko Radio Board incorporates an EFR32MG13P632F512GM48 Wireless System on Chip featuring 32-bit Cortex®-M4 with FPU core, 512 kB of flash memory, 64 kB of RAM and a 2.4 GHz band transceiver with output power up to 10 dBm. For additional information on the EFR32MG13P632F512GM48, refer to the EFR32MG13 Data Sheet.

3.3.2 LF Crystal Oscillator (LFXO)

The BRD4159A Radio Board has a 32.768 kHz crystal mounted. For details regarding the crystal configuration, refer to Application Note AN0016: Oscillator Design Considerations.

3.3.3 HF Crystal Oscillator (HFXO)

The BRD4159A Radio Board has a 38.4 MHz crystal mounted. For details regarding the crystal configuration, refer to Application Note AN0016: Oscillator Design Considerations.

3.3.4 Matching Network for 2.4 GHz

The BRD4159A Radio Board incorporates a 2.4 GHz matching network which connects the 2.4 GHz RF input/output of the EFR32MG13 to the one on-board printed Inverted-F antenna. The component values were optimized for the 2.4 GHz band RF performance and current consumption with 10 dBm output power.

For detailed description of the matching network, see Chapter [4.2.1 Description of the 2.4 GHz RF Matching](#).

3.3.5 UFL Connector

To be able to perform conducted measurements Silicon Labs added an UFL connector to the Radio Board. The connector allows an external 50 Ohm cable or antenna to be connected during design verification or testing.

Note: By default the output of the matching network is connected to the printed Inverted-F antenna by a series component. It can be connected to the UFL connector as well through a series 0 Ohm resistor which is not mounted by default. For conducted measurements through the UFL connector the series component to the antenna should be removed and the 0 Ohm resistor should be mounted (see Chapter [4.2 Schematic of the RF Matching Network](#) for further details).

3.3.6 Radio Board Connectors

Two dual-row, 0.05" pitch polarized connectors make up the BRD4159A Radio Board interface to the Wireless Starter Kit Mainboard.

For more information on the pin mapping between the EFR32MG13P632F512GM48 and the Radio Board Connector, refer to Chapter [2.2 Radio Board Connector Pin Associations](#).

3.3.7 Inverted-F Antenna

The BRD4159A Radio Board includes a printed inverted-F antenna (IFA) tuned to have close to 50 Ohm impedance at the 2.4 GHz band.

For detailed description of the antenna see Chapter [4.5 Inverted-F Antenna](#).

3.3.8 Serial Flash

The BRD4159A Radio Board is equipped with an 8 Mbit Macronix MX25R SPI flash that is connected directly to the EFR32MG13. For additional information on the pin mapping see the schematic of the BRD4159A.

3.3.9 Serial EEPROM

The BRD4159A Radio Board is equipped with a serial I²C EEPROM for board identification and to store additional board related information.

4. RF Section

4.1 Introduction

This section gives a short introduction to the RF section of the BRD4159A Radio Board.

4.2 Schematic of the RF Matching Network

The schematic of the RF section of the BRD4159A Radio Board is shown in the following figure.

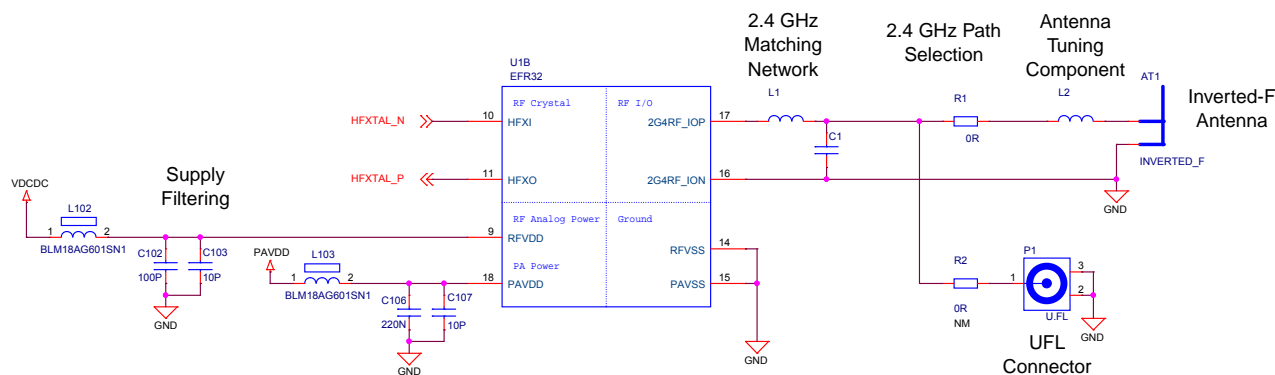

Figure 4.1. Schematic of the RF Section of the BRD4159A

4.2.1 Description of the 2.4 GHz RF Matching

The 2.4 GHz matching connects the 2G4RF_IOP pin to the on-board printed Inverted-F Antenna. The 2G4RF_ION pin is connected to ground. For lower output powers (under 13 dBm) additional harmonic filtering is not required as the harmonic levels are below the regulation limits (see Chapter 7.1 Conducted Power Measurements). Therefore, the matching network comprises only a two-element impedance matching circuitry. The targeted output power is 10 dBm.

For for conducted measurements the output of the matching network can also be connected to the UFL connector by removing the series R1 resistor between the antenna and the output of the matching and adding a 0 Ohm resistor to the R2 resistor position between the output of the matching and the UFL connector.

4.3 RF Section Power Supply

On the BRD4159A Radio Board the power supply pins of the RF section (RFVDD, PAVDD) are directly connected to the output of the on-chip DC-DC converter. This way, by default, the DC-DC converter provides 1.8 V for the entire RF section (for details, see the schematic of the BRD4159A).

4.4 Bill of Materials for the 2.4 GHz Matching

The Bill of Materials of the 2.4 GHz matching network of the BRD4159A Radio Board is shown in the following table.

Table 4.1. Bill of Materials for the BRD4159A 2.4GHz RF Matching Network

Component name	Value	Manufacturer	Part Number
L1	1.9 nH	Murata	LQP15MN1N9W02D
C1	1.5 pF	Murata	GRM1555C1H1R05WA01D

4.5 Inverted-F Antenna

The BRD4159A Radio Board includes an on-board printed inverted-F antenna tuned for the 2.4 GHz band. Due to the design restrictions of the Radio Board, the input of the antenna and the output of the matching network can't be placed directly next to each other. As a result, a 50 Ohm transmission line was necessary to connect them. With the actual line length the impedance of the antenna at the double-harmonic frequency is transformed closer to a critical impedance range. This reduces the low-pass filter effect of the matching network resulting in the increase of the radiated level of the harmonic.

To reduce the harmonic radiation a tuning component was used between the matching network output and the antenna input. For the actual Radio Board design (with the actual transmission line length) a small value inductor was used (L2 inductor with value of 1.9 nH) to transform the impedance at the double-frequency harmonic away from the critical region while keeping the impedance at the fundamental close to 50 Ohm. With this the suppression of the radiated double-frequency harmonic increases by approximately 12 dB. The resulting impedance is shown in the following figure.

Figure 4.2. Impedance and Reflection of the Inverted-F Antenna of the BRD4159A Board Measured from the Matching Output

Note: The suppression of the double-frequency harmonic can be further increased by using a slightly higher inductor value but for the current board the suppression achieved with 1.9 nH is sufficient (see Chapter 7.2 Radiated Power Measurements). Therefore, for BOM cost reduction the same value and type of inductor was used as the one in the 2.4 GHz matching network (L1).

5. Mechanical Details

The BRD4159A Radio Board is illustrated in the figures below.

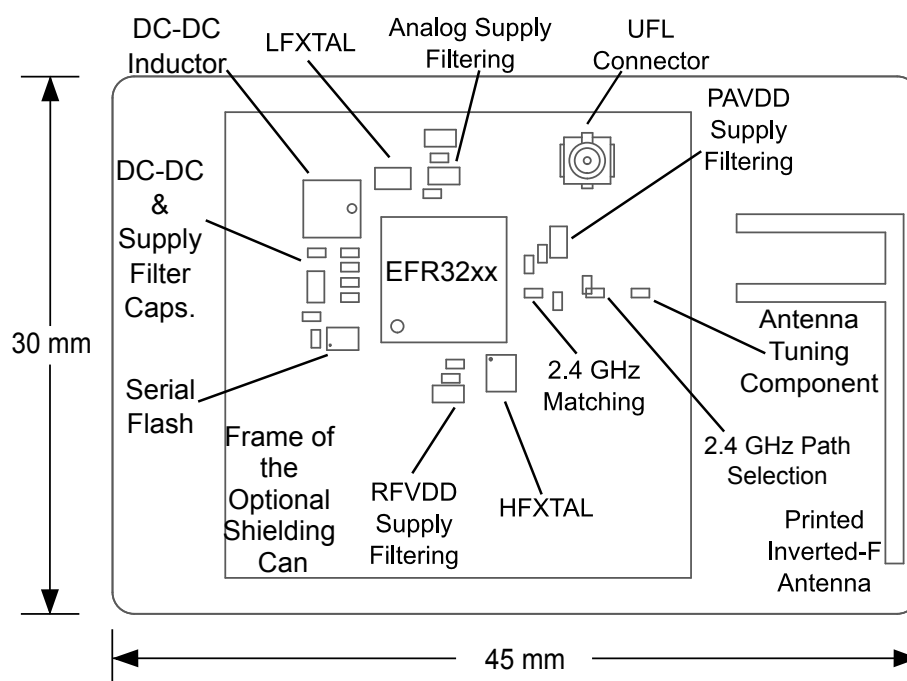

Figure 5.1. BRD4159A Top View

Figure 5.2. BRD4159A Bottom View

6. EMC Compliance

6.1 Introduction

Compliance of the fundamental and harmonic levels of the BRD4159A Radio Board is tested against the following standards:

- 2.4 GHz:
 - ETSI EN 300-328
 - FCC 15.247

6.2 EMC Regulations for 2.4 GHz

6.2.1 ETSI EN 300-328 Emission Limits for the 2400-2483.5 MHz Band

Based on ETSI EN 300-328 the allowed maximum fundamental power for the 2400-2483.5 MHz band is 20 dBm EIRP. For the unwanted emissions in the 1 GHz to 12.75 GHz domain the specified limit is -30 dBm EIRP.

6.2.2 FCC15.247 Emission Limits for the 2400-2483.5 MHz Band

FCC 15.247 allows conducted output power up to 1 Watt (30 dBm) in the 2400-2483.5 MHz band. For spurious emissions the limit is -20 dBc based on either conducted or radiated measurement, if the emission is not in a restricted band. The restricted bands are specified in FCC 15.205. In these bands the spurious emission levels must meet the levels set out in FCC 15.209. In the range from 960 MHz to the frequency of the 5th harmonic it is defined as 0.5 mV/m at 3 m distance which equals to -41.2 dBm in EIRP.

Additionally, for spurious frequencies above 1 GHz, FCC 15.35 allows duty-cycle relaxation to the regulatory limits. For the EmberZNet PRO the relaxation is 3.6 dB. Therefore, the -41.2 dBm limit can be modified to -37.6 dBm.

If operating in the 2400-2483.5 MHz band the 2nd, 3rd and 5th harmonics can fall into restricted bands. As a result, for those the -37.6 dBm limit should be applied. For the 4th harmonic the -20 dBc limit should be applied.

6.2.3 Applied Emission Limits for the 2.4 GHz Band

The above ETSI limits are applied both for conducted and radiated measurements.

The FCC restricted band limits are radiated limits only. Besides that, Silicon Labs applies those to the conducted spectrum i.e. it is assumed that, in case of a custom board, an antenna is used which has 0 dB gain at the fundamental and the harmonic frequencies. In that theoretical case, based on the conducted measurement, the compliance with the radiated limits can be estimated.

The overall applied limits are shown in the table below.

Table 6.1. Applied Limits for Spurious Emissions for the 2.4 GHz Band

Harmonic	Frequency	Limit
2nd	4800~4967 MHz	-37.6 dBm
3rd	7200~7450.5 MHz	-37.6 dBm
4th	9600~9934 MHz	-30 dBm
5th	12000~12417.5 MHz	-37.6 dBm

7. RF Performance

7.1 Conducted Power Measurements

During measurements, the BRD4159A Radio Board was attached to a Wireless Starter Kit Mainboard which was supplied by USB. The voltage supply for the Radio Board was 3.3 V.

7.1.1 Conducted Measurements in the 2.4 GHz band

The BRD4159A Radio Board was connected directly to a Spectrum Analyzer through its UFL connector (the R1 resistor was removed and a 0 Ohm resistor was soldered to the R2 resistor position). The supply for the RF section (RFVDD) and the 2.4 GHz power amplifier (PAVDD) was 1.8 V provided by the on-chip DC-DC converter; for details, see the schematic of the BRD4159A. The transceiver was operated in continuous carrier transmission mode. The output power of the radio was set to 10 dBm.

The typical output spectrum is shown in the following figure.

Figure 7.1. Typical Output Spectrum of the BRD4159A

As it can be observed, the fundamental is close to 10 dBm and all of the unwanted emissions are under the -37.6 dBm applied limit.

Note: The conducted measurement is performed by connecting the on-board UFL connector to a Spectrum Analyzer through an SMA Conversion Adapter (P/N: HRMJ-U.FLP(40)). This connection itself introduces approximately 0.3 dB insertion loss.

7.2 Radiated Power Measurements

During measurements, the BRD4159A Radio Board was attached to a Wireless Starter Kit Mainboard which was supplied by USB. The voltage supply for the Radio Board was 3.3 V. The radiated power was measured in an antenna chamber by rotating the board 360 degrees with horizontal and vertical reference antenna polarizations in the XY, XZ and YZ cuts. The measurement planes are shown in the figure below.

Figure 7.2. Illustration of reference planes with a Radio Board plugged into the Wireless Starter Kit Mainboard

Note: The radiated measurement results presented in this document were recorded in an unlicensed antenna chamber. Also the radiated power levels may change depending on the actual application (PCB size, used antenna, and so on). Therefore, the absolute levels and margins of the final application are recommended to be verified in a licensed EMC testhouse.

7.2.1 Radiated Measurements in the 2.4 GHz band

For the transmitter antenna the on-board printed inverted-F antenna of the BRD4159A Radio Board was used (the R1 resistor was mounted). The supply for the RF section (RFVDD) and the 2.4 GHz power amplifier (PAVDD) was 1.8 V provided by the on-chip DC-DC converter; for details, see the schematic of the BRD4159A. The transceiver was operated in continuous carrier transmission mode. The output power of the radio was set to 10 dBm based on the conducted measurement.

The results are shown in the table below.

Table 7.1. Maximums of the measured radiated powers in EIRP [dBm]

Frequency	EIRP [dBm]	Orientation	Margin [dB]	Limit in EIRP [dBm]
Fund	13.2	XZ/H	16.8	30
2nd	-55.4	XZ/V	17.8	-37.6
3rd	<-50*	-/-	>10	-37.6
4th	<-50*	-/-	>10	-30
5th	<-50*	-/-	>10	-37.6

* Signal level is below the Spectrum Analyzer noise floor.

As it can be observed, thanks to the high gain of the inverted-F antenna, the level of the fundamental is higher than 10 dBm. The strongest harmonic is the double-frequency one and thanks to the additional suppression provided by the L2 inductor its level is under -50 dBm.

8. EMC Compliance Recommendations

8.1 Recommendations for 2.4 GHz ETSI EN 300-328 compliance

As it was shown in the previous chapter, the radiated power of the fundamental of the BRD4159A Mighty Gecko Radio Board complies with the 20 dBm limit of the ETSI EN 300-328 both in case of the conducted and the radiated measurements. The harmonic emissions are under the -30 dBm limit. Although the BRD4159A Radio Board has an option for mounting a shielding can, that is not required for the compliance.

8.2 Recommendations for 2.4 GHz FCC 15.247 compliance

As it was shown in the previous chapter, the radiated power of the fundamental of the BRD4159A Mighty Gecko Radio Board complies with the 30 dBm limit of the FCC 15.247. The harmonic emissions are under the -37.6 dBm applied limit both in case of the conducted and the radiated measurements. Although the BRD4159A Radio Board has an option for mounting a shielding can, that is not required for the compliance.
