

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# SP7656 Evaluation Board Manual

- Wide Input Voltage Range 5V – 29V
- 3 Amps Continuous 4 Amps Peak Output Current
- Internal Compensation
- Input Feedforward Control
- 600kHz Constant Frequency Operation
- Low 0.6V Reference Voltage
- High output setpoint accuracy of 1%
- Internal Soft Start
- Small SO8-EP Thermally Enhanced Package
- Adjustable Overcurrent Protection
- Lead Free, RoHS Compliant Package

## SP7656EB SCHEMATIC

## USING THE EVALUATION BOARD

### 1) Powering Up the SP7656EB Circuit

Connect the Vin supply to the “VIN” and “GND” posts of SP7656 Evaluation Board with short leads. Connect a Load between the VOUT and GND posts, again using short leads to minimize parasitic inductance and voltage drop.

### 2) Measuring Output Load Characteristics

It's best to GND reference scope and digital meters using a single GND post in the output of the board. VOUT ripple can best be seen touching probe tip to the pad for C4 and scope GND collar touching Star GND post – avoid a GND lead on the scope which will increase noise pickup.

### 3) Using the Evaluation Board with Different Output Voltages

While the SP7656 Evaluation Board has been tested and delivered with the output set to 3.3V, by simply changing one resistor, R2, the SP7656 can be set to other output voltages. The relationship in the Equation 1 is based on a voltage divider from the output to the feedback pin VFB, which is set to an internal reference voltage of 0.60V. Standard 1% metal film resistors of surface mount size 0603 are recommended.

$$R2 = \frac{R1}{\left(\frac{V_{out}}{0.6V} - 1\right)} \quad \text{Equation 1}$$

R1 resistance must remain 200kΩ for overall system loop stability.

Note that since the SP7656 Evaluation Board design was optimized for 12V down conversion to 3.3V, changes of output voltage and/or input voltage will alter performance from the data given in the Power Supply Data section.

## POWER SUPPLY DATA

The SP7656ER is designed with an accurate 2.0% reference over line, load and temperature. Figure 1 & 2 data show a typical SP7656 evaluation board efficiency and regulation plots, with efficiencies up to 87% and output currents up to 4A. The output voltage ripple of less than 6.6mV at full load and the LX node are shown in Figure 3. Figures 4 and 5 illustrate a 0.3A to 3A and 1.5A to 3A Load Step. Hiccup due to overcurrent is shown in Figure 6. Typical startup characteristics into a full load and no load are shown in Figure 7 and 8. All waveforms were taken under 12V to 3.3V conversion.

While data on individual power supply boards may vary, the capability of the SP7656ER of achieving a high accuracy over a range of load conditions shown here is quite impressive and desirable for accurate power supply design.
