4.2 Recommended operating conditions

The following table describes the operating conditions for the device, and for which all specifications in the data sheet are valid, except where explicitly noted. The device operating conditions must not be exceeded in order to guarantee proper operation and reliability. The ranges in this table are design targets and actual data may vary in the given range.

NOTE

- For normal device operations, all supplies must be within operating range corresponding to the range mentioned in following tables. This is required even if some of the features are not used.
- If VDD_HV_A is in 3.3V range, VDD_HV_FLA should be externally supplied using a 3.3V source. If VDD_HV_A is in 3.3V range, VDD_HV_FLA should be shorted to VDD_HV_A.
- VDD_HV_A, VDD_HV_B and VDD_HV_C are all independent supplies and can each be set to 3.3V or 5V. The following tables: 'Recommended operating conditions (VDD_HV_x = 3.3 V)' and table 'Recommended operating conditions (VDD_HV_x = 5 V)' specify their ranges when configured in 3.3V or 5V respectively.

Table 6. Recommended operating conditions ($V_{DD\_HV\_x}$ = 3.3 V)

4.3 Voltage regulator electrical characteristics

The voltage regulator is composed of the following blocks:

  - Control of external NPN ballast transistor
  - Connecting an external 1.25 V (nominal) supply directly without the NPN ballast
- Internal generation of the 3.3 V flash supply when device connected in 5V applications
- External bypass of the 3.3 V flash regulator when device connected in 3.3V applications
- Low voltage detector - low threshold (LVD_IO_A_LO) for $V_{DD\_HV\_IO\_A\ supply}$
- Low voltage detector - high threshold (LVD_IO_A_Hi) for $V_{DD\_HV\_IO\_A\ supply}$

C_{HV_ADR}[6]	HV ADC SAR reference supply decoupling capacitances	Min, max values shall be granted with respect to tolerance, voltage, temperature, and aging variations.	0.47	—	—	µF
$V_{DD\_HV\_BALLAST}$[7]	FPREG Ballast collector supply voltage	When collector of NPN ballast is directly supplied by an on board supply source (not shared with VDD_HV_A supply pin) without any series resistance, that is, $R_{C\_BALLAST}$ less than 0.01 Ohm.	2.25	—	5.5	V
$R_{C\_BALLAST}$	Series resistor on collector of FPREG ballast	When VDD_HV_BALLAST is shorted to VDD_HV_A on the board	—	—	0.1	Ohm
t_{SU}	Start-up time after main supply stabilization	Cfp_reg = 3 µF	—	74	—	µs
t_{ramp}	Load current transient	Iload from 15% to 55% C_{fp_reg} = 3 µF		1.0		µs

1. Split capacitance on each pair VDD_LV pin should sum up to a total value of C_{fp_reg}
2. Typical values will vary over temperature, voltage, tolerance, drift, but total variation must not exceed minimum and maximum values.
3. Ceramic X7R or X5R type with capacitance-temperature characteristics +/-15% of -55 degC to +125degC is recommended. The tolerance +/-20% is acceptable.
4. It is required to minimize the board parasitic inductance from decoupling capacitor to VDD_HV_FLA pin and the routing inductance should be less than 1nH.
5. 1. For VDD_HV_A, VDD_HV_B, and VDD_HV_C, 1µf on each side of the chip
      a. 0.1 µf close to each VDD/VSS pin pair.
      b. 10 µf near for each power supply source
      c. For VDD_LV, 0.1uf close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP_REG parameter.
   2. For VDD_LV, 0.1uf close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP_REG parameter
6. Only applicable to ADC1

7. In external ballast configuration the following must be ensured during power-up and power-down (Note: If $V_{DD\_HV\_BALLAST}$ is supplied from the same source as VDD_HV_A this condition is implicitly met):
   - During power-up, $V_{DD\_HV\_BALLAST}$ must have met the min spec of 2.25V before VDD_HV_A reaches the POR_HV_RISE min of 2.75V.
   - During power-down, $V_{DD\_HV\_BALLAST}$ must not drop below the min spec of 2.25V until VDD_HV_A is below POR_HV_FALL min of 2.7V.

NOTE

For a typical configuration using an external ballast transistor with separate supply for VDD_HV_A and the ballast collector, a bulk storage capacitor (as defined in Table 8) is required on VDD_HV_A close to the device pins to ensure a stable supply voltage.

Extra care must be taken if the VDD_HV_A supply is also being used to power the external ballast transistor or the device is running in internal regulation mode. In these modes, the inrush current on device Power Up or on exit from Low Power Modes is significant and may cause the VDD_HV_A voltage to drop resulting in an LVD reset event. To avoid this, the board layout should be optimized to reduce common trace resistance or additional capacitance at the ballast transistor collector (or VDD_HV_A pins in the case of internal regulation mode) is required. NXP recommends that customers simulate the external voltage supply circuitry.

In all circumstances, the voltage on VDD_HV_A must be maintained within the specified operating range (see Recommended operating conditions) to prevent LVD events.

1. All monitors that are active at power-up will gate the power up recovery and prevent exit from POWERUP phase until the minimum level is crossed. These monitors can in some cases be masked during normal device operation, but when active will always generate a destructive reset.
2. There is no voltage monitoring on the $V_{DD\_HV\_ADC0}$, $V_{DD\_HV\_ADC1}$, $V_{DD\_HV\_B}$ and $V_{DD\_HV\_C}$ I/O segments. For applications requiring monitoring of these segments, either connect these to $V_{DD\_HV\_A}$ at the PCB level or monitor externally.

4.6 Electrostatic discharge (ESD) characteristics

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n + 1) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard.

NOTE

A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing shall be performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

1. As measured from 50% of core side input to Voh/Vol of the output
2. Slew rate control modes

NOTE

The above specification is based on simulation data into an ideal lumped capacitor. Customer should use IBIS models for their specific board/loading conditions to simulate the expected signal integrity and edge rates of their system.

NOTE

The above specification is measured between 20% / 80%.
