

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

SPI-8001TW/SPI-8002TW/SPI-8003TW**2-Output, Step-down Switching Mode****■Features**

- 2 regulators combined in one package
- Output current: 1.5A × 2 (HSOP 16 Pin Surface mount package)
- High efficiency: TYP80% (SPI-8001TW), TYP78% (SPI-8002TW)
- Variable output voltage: 1.0 to 16V (SPI-8001TW), 1.0 to 24V (SPI-8002TW)
- Built-in reference oscillator (250kHz): Enables to downsize a choke-coil
- Low circuit current consumption: $\leq 1\mu\text{A}$ (at output OFF)
- High accuracy reference voltage: $\pm 1\%$
- Built-in foldback-overcurrent and thermal protection circuits
- Built-in ON/OFF circuit (soft start available) – per output

■Absolute Maximum Ratings^{*1}

Parameter	Symbol	Ratings			Unit
		SPI-8001TW	SPI-8002TW	SPI-8003TW	
Input Voltage	V _{IN}	21	40	40	V
	V _{CC}	21	40	40	V
	V _{C/E}	21	40	40	V

Storage Temperature	T _{stg}		-40 to +135	-40 to +150	°C
Thermal Resistance (junction to case) ^{*2}	θ_{j-c}		9.0		°C/W
Thermal Resistance (junction to ambient air) ^{*2}	θ_{j-a}		35.8		°C/W

*1: Absolute maximum ratings show the destructive limit. No parameter should exceed the ratings in transient or normal operations.

*2: When mounted on glass-epoxy board 70cm² (copper laminate area 30.8cm²).

*3: Limited by thermal protection.

■Applications

- Onboard local power supplies
- OA equipment
- For stabilization of the secondary-side output voltage of switching power supplies

^{*1}: Electrical characteristics show the characteristic ratings guaranteed when operating the ICs under the measurement conditions described in the above table.^{*2}: Efficiency is calculated from the following formula.

$$\eta (\%) = \frac{V_o \cdot I_o}{V_{IN} \cdot I_{IN}} \times 100$$

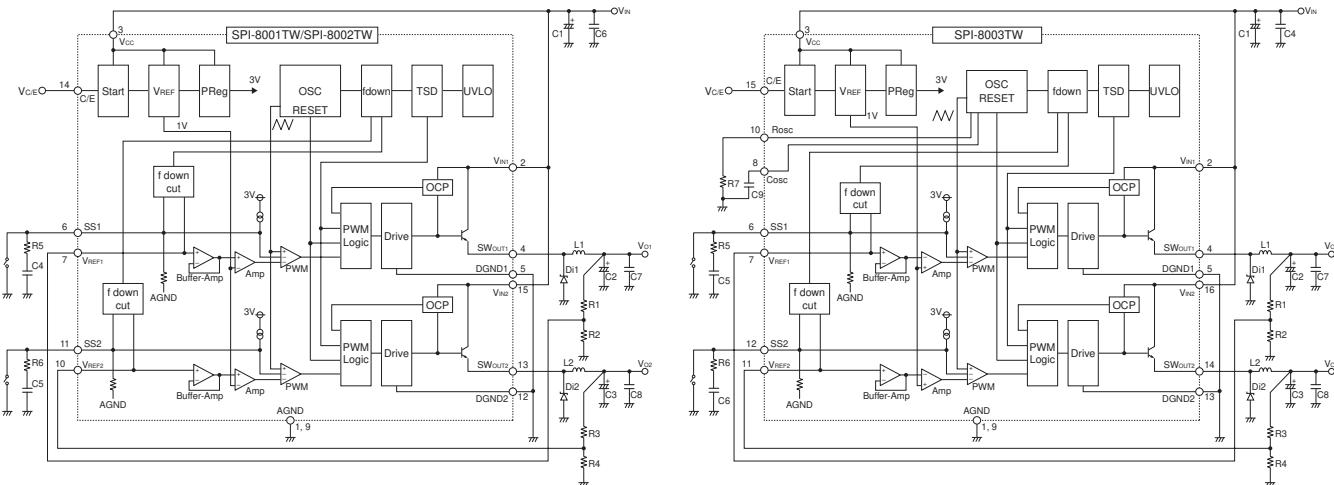

^{*3}: Pin 6 and pin 11 are the SS pins. Soft start at power on can be performed with capacitors connected to these pins. The outputs can also be turned ON/OFF with these pins. The outputs are stopped by setting the voltages of these pins to V_{SSL} or lower. SS-pin voltages can be changed with open-collector drive circuits of transistors.When using both the soft-start and ON/OFF functions together, the discharge currents from C₄ and C₅ flow into the ON/OFF control transistors respectively. Therefore, limit the currents securely to protect the transistors if C₄ and C₅ capacitances are large. The SS pins are pulled up to the power supply in the ICs, so applying the external voltages are prohibited.

Diodes Di1, Di2

- Be sure to use Schottky-barrier diodes for Di1 and Di2.
If other diodes like fast recovery diodes are used, IC may be destroyed because of the reverse voltage generated by the recovery voltage or ON voltage.

Choke coils L1, L2

- If the winding resistance of the choke coil is too high, the efficiency may drop below the rated value.
- As the overcurrent protection starting current is about 2.0A, take care concerning heat radiation from the choke coil caused by magnetic saturation due to overload or short-circuited load.
- Use a closed-magnetic-path coil to prevent interference between the channels SW_{out1} and SW_{out2}.

Capacitors C1, C2, C3

- As large ripple currents flow through C1, C2 and C3, use high-frequency and low-impedance capacitors suitable for switching mode power supplies. Especially when the impedance of C2 and C3 are high, the switching waveforms may become abnormal at low temperatures. For C2 and C3, do not use capacitors with extremely low equivalent series resistance (ESR) such as OS capacitors or tantalum capacitors, which may cause abnormal oscillation.

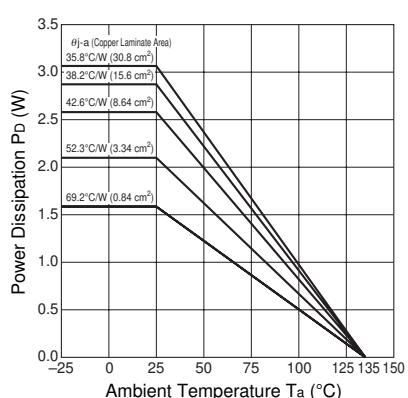

Resistors R1, R2, R3, R4

- R1, R2, R3 and R4 are resistors for setting output voltages. Set the resistors so that I_{REF} is approx. 1 mA. For example, R1 and R2 can be calculated as shown below.

$$R1 = \frac{(V_{O1} - V_{REF1})}{I_{REF1}} = \frac{(V_{O1} - V)}{1 \times 10^{-3}} (\Omega), R2 = \frac{V_{REF1}}{I_{REF1}} = \frac{1}{1 \times 10^{-3}} \approx 1(K\Omega)$$

◎ To create the optimum operating conditions, place the components as close as possible to each other.

■ Ta-Pd Characteristics

$$P_d = V_o \cdot I_o \left(\frac{100}{\eta\chi} - 1 \right) - V_F \cdot I_o \left(1 - \frac{V_o}{V_{IN}} \right)$$

V_o : Output Voltage

V_{IN} : Input Voltage

I_o : Output Current

$\eta\chi$: Efficiency (%)

V_F : D₁ Forward Voltage

SJPB-H6...0.45V (I_o=1A)

Note 1: The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

Note 2: Thermal design for D₁ must be considered separately.
