 $V_o$  is the desired output voltage  
 $D$  is the external PWM signal duty cycle.

**14. OCP**

To provide protection in a fault output overload condition, the module is equipped with internal current-limiting circuitry and can endure current limiting for a few milli-seconds. If the overcurrent condition persists beyond a few milliseconds, the module will shut down into hiccup mode and restart once every 14mS. The module operates normally when the output current goes into specified range. The typical average output current is 3A during hiccup.

$V_{in}=12V, V_o=0.9V$

$V_{in}=12V, V_o=0.6V$

**15. INPUT UNDER-VOLTAGE LOCKOUT**

**16. POWER GOOD**

1. This module has a power good indicator output. Power good pin used positive logic and is open collector.
2. Maximum power good pin sinking current is 10mA.
3. The maximum voltage pulled up externally on Power Good pin should not exceed 5V.
4. When the output reaches 90% of the nominal set-point, the power good pin will be pulled high.

## 17. SOLDERING INFORMATION

The SRPE-50E1A0G modules are designed to be compatible with a Paste-In-Hole assembly process. The suggested Pb-free solder paste is Sn/Ag/Cu(SAC). The recommended reflow profile using Sn/Ag/Cu solder is shown in the following. Recommended reflow peak temperature is 245 °C while the part can withstand peak temperature of 260 °C maximum for 10seconds. This profile should be used only as a guideline. Many other factors influence the success of SMT reflow soldering. Since your production environment may differ, please thoroughly review these guidelines with your process engineers.

## 18. MSL RATING

The SRPE-50E1A0G modules have a MSL rating of 3.

## 19. STORAGE AND HANDLING

The SRPE-50E1A0G modules are designed to be compatible with J-STD-033 Rev:A (Handling, Packing, Shipping and Use of Moisture /Reflow Sensitive surface Mount devices). Moisture barrier bags (MBB) with desiccant are applied. The recommended storage environment and handling procedure is detailed in J-STD-033.

## 20. PRE-BAKING

This component has been designed, handled, and packaged ready for pb-free reflow soldering. If the assembly shop follows J-STD-033 guidelines, no pre-bake of this component is required before being reflowed to a PCB. However, if the J-STD-033 guidelines are not followed by the assembler, Bel recommends that the modules should be pre-baked @ 120~125 °C for a minimum of 4 hours (preferably 24 hours) before reflow soldering.
