Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Description

This 25-bit 1:1 or 14-bit 1:2 configurable registered buffer is designed for 1.7-V to 1.9-V VDD operation.

All clock and data inputs are compatible with the JEDEC standard for SSTL_18. The control inputs are LVCMOS. All outputs are 1.8-V CMOS drivers that have been optimized to drive the DDR-II DIMM load. ICSSSTUAF32866B operates from a differential clock (CLK and $\overline{\text{CLK}}$). Data are registered at the crossing of CLK going high, and $\overline{\text{CLK}}$ going low.

The C0 input controls the pinout configuration of the 1:2 pinout from A configuration (when low) to B configuration (when high). The C1 input controls the pinout configuration from 25-bit 1:1 (when low) to 14-bit 1:2 (when high).

A - Pair Configuration (C01 = 0, C11 = 1 and C02 = 0, C12 = 1)

Parity that arrives one cycle after the data input to which it applies is checked on the PAR_IN of the first register. The second register produces to PPO and $\overline{\text{QERR}}$ signals. The $\overline{\text{QERR}}$ of the first register is left floating. The valid error information is latched on the $\overline{\text{QERR}}$ output of the second register. If an error occurs $\overline{\text{QERR}}$ is latched low for two cycles or until $\overline{\text{RESET}}$ is low.

B - Single Configuration (C0 = 0, C1 = 0)

The device supports low-power standby operation. When the $\overline{\text{RESET}}$ input ($\overline{\text{RESET}}$) is low, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (VREF) inputs are allowed. In addition, when $\overline{\text{RESET}}$ is low all registers are reset, and all outputs are forced low. The LVCMOS $\overline{\text{RESET}}$ and Cn inputs must always be held at a valid logic high or low level. To ensure defined outputs from the register before a stable clock has been supplied, $\overline{\text{RESET}}$ must be held in the low state during power up.

In the DDR-II RDIMM application, $\overline{\text{RESET}}$ is specified to be completely asynchronous with respect to CLK and $\overline{\text{CLK}}$. Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers. As long as the data inputs are low, and the clock is stable during the time from the low-to-high transition of $\overline{\text{RESET}}$ until the input receivers are fully enabled, the

design of the ICSSSTUAF32866B must ensure that the outputs will remain low, thus ensuring no glitches on the output.

The device monitors both $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ inputs and will gate the Qn outputs from changing states when both $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ inputs are high. If either $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ input is low, the Qn outputs will function normally. The $\overline{\text{RESET}}$ input has priority over the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ control and will force the outputs low. If the $\overline{\text{DCS}}$-control functionality is not desired, then the $\overline{\text{CSR}}$ input can be hardwired to ground, in which case, the setup-time requirement for $\overline{\text{DCS}}$ would be the same as for the other D data inputs. Package options include 96-ball LFBGA (MO-205CC).

Features

- 25-bit 1:1 or 14-bit 1:2 registered buffer with parity check functionality
- Supports SSTL_18 JEDEC specification on data inputs and outputs
- Supports LVCMOS switching levels on C0, C1, and $\overline{\text{RESET}}$ inputs
- Low voltage operation: VDD = 1.7V to 1.9V
- Drop-in replacement for ICSSSTUA32864
- Available in 96-ball BGA package

Applications

- DDR2 Memory Modules
- Provides complete DDR DIMM solution with ICS98ULPA877A or IDTCSPUA877A
- Ideal for DDR2 400, 533, and 667

Absolute Maximum Ratings

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Item		Rating
Supply Voltage, V_{DD}		-0.5V to 2.5V
Input Voltage Range, V_I[1]		-0.5V to 2.5V
Output Voltage Range, V_O[1,2]		-0.5V to V_{DD} + 0.5V
Input Clamp Current, I_{IK}		±50mA
Output Clamp Current, I_{OK}		±50mA
Continuous Output Clamp Current, I_O		±50mA
Continuous Current through each V_{DD} or GND		±100mA
Package Thermal Impedance (θja)[3]	0m/s Airflow	70.9° C/W
	1m/s Airflow	65° C/W
Storage Temperature		-65 to +150° C

1   The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.
2   This current will flow only when the output is in the high state level V_O > V_{DDQ}.
3   The package thermal impedance is calculated in accordance with JESD 51.

1. If the data is clocked in on the n clock pulse, the $\overline{QERR}$ output signal will be generated on the n+1 clock pulse, and it will be valid on the n+2 clock pulse. If an error occurs and the $\overline{QERR}$ output is driven low, it stays latched low for a minimum of two clock cycles or until $\overline{RESET}$ is driven low.
2. PAR_IN is driven from PPO of the first SSTUAF32866 device.

Register Timing

Timing Diagram for the First SSTUAF32866B (1:2 Register-A Configuration) Device Used in a Pair; C0 = 1, C1 = 1; $\overline{\text{RESET}}$ Switches from H to L

NOTE:
1. After $\overline{\text{RESET}}$ is switched from HIGH to LOW, all data and clock inputs signals must be set and held at valid logic levels (not floating) for a minimum time of $t_{INACTMAX}$.
