Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

SSTUH32866

1.8 V high output drive 25-bit 1 : 1 or 14-bit 1 : 2 configurable registered buffer with parity for DDR2 RDIMM applications

Rev. 01 — 13 May 2005 Product data sheet

1. General description

The SSTUH32866 is a 1.8 V configurable register specifically designed for use on DDR2 memory modules requiring a parity checking function. It is defined in accordance with the JEDEC JESD82-7 standard for the SSTU32864 registered buffer, while adding the parity checking function in a compatible pinout. The JEDEC standard for SSTUH32866 is pending publication. The register is configurable (using configuration pins C0 and C1) to two topologies: 25-bit 1 : 1 or 14-bit 1 : 2, and in the latter configuration can be designated as Register A or Register B on the DIMM.

The SSTUH32866 accepts a parity bit from the memory controller on its parity bit (PAR_IN) input, compares it with the data received on the DIMM-independent D-inputs and indicates whether a parity error has occurred on its open-drain $\overline{\text{QERR}}$ pin (active LOW). The convention is even parity, that is, valid parity is defined as an even number of ones across the DIMM-independent data inputs combined with the parity input bit.

The SSTUH32866 is packaged in a 96-ball, 6 $\times$ 16 grid, 0.8 mm ball pitch LFBGA package (13.5 mm $\times$ 5.5 mm).

The SSTUH32866 is identical to SSTU32866 in function and performance, with higher-drive outputs optimized to drive heavy load nets (for example, stacked DRAMs) while maintaining speed and signal integrity.

2. Features

- Configurable register supporting DDR2 Registered DIMM applications
- Higher output drive strength version of SSTU32866 optimized for high-capacitive load nets
- Configurable to 25-bit 1 : 1 mode or 14-bit 1 : 2 mode
- Controlled output impedance drivers enable optimal signal integrity and speed
- Exceeds JESD82-7 speed performance (1.8 ns max. single-bit switching propagation delay; 2.0 ns max. mass-switching)
- Supports up to 450 MHz clock frequency of operation
- Optimized pinout for high-density DDR2 module design
- Chip-selects minimize power consumption by gating data outputs from changing state
- Supports SSTL_18 data inputs
- Checks parity on the DIMM-independent data inputs
- Partial parity output and input allows cascading of two SSTUH32866s for correct parity error processing
- Differential clock (CK and $\overline{\text{CK}}$) inputs

PHILIPS

- Supports LVCMOS switching levels on the control and $\overline{\text{RESET}}$ inputs
- Single 1.8 V supply operation
- Available in 96-ball, 13.5 mm × 5.5 mm, 0.8 mm ball pitch LFBGA package

3. Applications

- DDR2 registered DIMMs desiring parity checking functionality
- Stacked or planar high-DRAM count registered DIMMs

4. Ordering information

6.2 Pin description

Table 2: Pin description

Symbol	Pin	Type	Description
GND	B3, B4, D3, D4, F3, F4, H3, H4, K3, K4, M3, M4, P3, P4	ground input	ground
V_{DD}	A4, C3, C4, E3, E4, G3, G4, J3, J4, L3, L4, N3, N4, R3, R4, T4	1.8 V nominal	power supply voltage
VREF	A3, T3	0.9 V nominal	input reference voltage
CK	H1	Differential input	positive master clock input
$\overline{CK}$	J1	Differential input	negative master clock input
C0	G6	LVCMOS inputs	Configuration control inputs; Register A or Register B and 1 : 1 mode or 1 : 2 mode select.
C1	G5		
$\overline{RESET}$	G2	LVCMOS input	Asynchronous reset input (active LOW). Resets registers and disables VREF data and clock.
$\overline{CSR}$	J2	SSTL_18 input	Chip select inputs (active LOW). Disables D1 to D25 [2] outputs switching when both inputs are HIGH.
$\overline{DCS}$	H2		
D1 to D25	[1]	SSTL_18 input	Data input. Clocked in on the crossing of the rising edge of CK and the falling edge of $\overline{CK}$.
DODT	[1]	SSTL_18 input	The outputs of this register bit will not be suspended by the $\overline{DCS}$ and $\overline{CSR}$ control.
DCKE	[1]	SSTL_18 input	The outputs of this register bit will not be suspended by the $\overline{DCS}$ and $\overline{CSR}$ control.
PAR_IN	G1	SSTL_18 input	Parity input. Arrives one clock cycle after the corresponding data input.
Q1 to Q25, Q2A to Q14A, Q1B to Q14B	[1]	1.8 V CMOS outputs	Data outputs that are suspended by the $\overline{DCS}$ and $\overline{CSR}$ control [3].
PPO	A2	1.8 V CMOS output	Partial parity out. Indicates odd parity of inputs D1 to D25 [2].
$\overline{QCS}$, $\overline{QCSA}$, $\overline{QCSB}$	[1]	1.8 V CMOS output	Data output that will not be suspended by the $\overline{DCS}$ and $\overline{CSR}$ control.
QODT, QODTA, QODTB	[1]	1.8 V CMOS output	Data output that will not be suspended by the $\overline{DCS}$ and $\overline{CSR}$ control.
QCKE, QCKEA, QCKEB	[1]	1.8 V CMOS output	Data output that will not be suspended by the $\overline{DCS}$ and $\overline{CSR}$ control.

Table 2: Pin description *...continued*

Symbol	Pin	Type	Description
$\overline{QERR}$	D2	open-drain output	Output error bit (active LOW). Generated one clock cycle after the corresponding data output
n.c.	[1]	-	Not connected. Ball present but no internal connection to the die.
DNU	[1]	-	Do not use. Inputs are in standby-equivalent mode and outputs are driven LOW.

[1] Depends on configuration. See Figure 4, Figure 5, and Figure 6 for ball number.

[2] Data inputs = D2, D3, D5, D6, D8 to D25 when C0 = 0 and C1 = 0.
Data inputs = D2, D3, D5, D6, D8 to D14 when C0 = 0 and C1 = 1.
Data inputs = D1 to D6, D8 to D10, D12, D13 when C0 = 1 and C1 = 1.

[3] Data outputs = Q2, Q3, Q5, Q6, Q8 to Q25 when C0 = 0 and C1 = 0.
Data outputs = Q2, Q3, Q5, Q6, Q8 to Q14 when C0 = 0 and C1 = 1.
Data outputs = Q1 to Q6, Q8 to Q10, Q12, Q13 when C0 = 1 and C1 = 1.

7. Functional description

The SSTUH32866 is a 25-bit 1 : 1 or 14-bit 1 : 2 configurable registered buffer with parity, designed for 1.7 V to 1.9 V V_{DD} operation.

All clock and data inputs are compatible with the JEDEC standard for SSTL_18. The control and reset ($\overline{RESET}$) inputs are LVCMOS. All data outputs are 1.8 V CMOS drivers that have been optimized to drive the DDR2 DIMM load, and meet SSTL_18 specifications. The error ($\overline{QERR}$) output is 1.8 V open-drain driver.

The SSTUH32866 operates from a differential clock (CK and $\overline{CK}$). Data are registered at the crossing of CK going HIGH, and CK going LOW.

The C0 input controls the pinout configuration for the 1 : 2 pinout from A configuration (when LOW) to B configuration (when HIGH). The C1 input controls the pinout configuration from 25-bit 1 : 1 (when LOW) to 14-bit 1 : 2 (when HIGH).

The SSTUH32866 accepts a parity bit from the memory controller on its parity bit (PAR_IN) input, compares it with the data received on the DIMM-independent D-inputs and indicates whether a parity error has occurred on its open-drain $\overline{QERR}$ pin (active LOW). The convention is even parity, that is, valid parity is defined as an even number of ones across the DIMM-independent data inputs combined with the parity input bit.

When used as a single device, the C0 and C1 inputs are tied LOW. In this configuration, parity is checked on the PAR_IN input which arrives one cycle after the input data to which it applies. The partial-parity-out (PPO) and $\overline{QERR}$ signals are produced three cycles after the corresponding data inputs.

When used in pairs, the C0 input of the first register is tied LOW and the C0 input of the second register is tied HIGH. The C1 input of both registers are tied HIGH. Parity, which arrives one cycle after the data input to which it applies, is checked on the PAR_IN input of the first device. The PPO and $\overline{QERR}$ signals are produced on the second device three clock cycles after the corresponding data inputs. The PPO output of the first register is

cascaded to the PAR_IN of the second register. The $\overline{QERR}$ output of the first register is left floating and the valid error information is latched on the $\overline{QERR}$ output of the second register.

If an error occurs and the $\overline{QERR}$ output is driven LOW, it stays latched LOW for two clock cycles or until $\overline{RESET}$ is driven LOW. The DIMM-dependent signals (DCKE, $\overline{DCS}$, DODT, and $\overline{CSR}$) are not included in the parity check computation.

The device supports low-power standby operation. When $\overline{RESET}$ is LOW, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (VREF) inputs are allowed. In addition, when $\overline{RESET}$ is LOW all registers are reset, and all outputs are forced LOW. The LVCMOS $\overline{RESET}$ input must always be held at a valid logic HIGH or LOW level.

The device also supports low-power active operation by monitoring both system chip select ($\overline{DCS}$ and $\overline{CSR}$) inputs and will gate the Qn and PPO outputs from changing states when both $\overline{DCS}$ and $\overline{CSR}$ inputs are HIGH. If either $\overline{DCS}$ or $\overline{CSR}$ input is LOW, the Qn and PPO outputs will function normally. The $\overline{RESET}$ input has priority over the $\overline{DCS}$ and $\overline{CSR}$ control and when driven LOW will force the Qn and PPO outputs LOW, and the $\overline{QERR}$ output HIGH. If the $\overline{DCS}$ control functionality is not desired, then the $\overline{CSR}$ input can be hard-wired to ground, in which case, the setup time requirement for $\overline{DCS}$ would be the same as for the other Dn data inputs. To control the low-power mode with $\overline{DCS}$ only, then the $\overline{CSR}$ input should be pulled up to V_{DD} through a pull-up resistor.

To ensure defined outputs from the register before a stable clock has been supplied, $\overline{RESET}$ must be held in the LOW state during power-up.

In the DDR2 RDIMM application, $\overline{RESET}$ is specified to be completely asynchronous with respect to CK and $\overline{CK}$. Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the Qn outputs will be driven LOW quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers. As long as the data inputs are LOW, and the clock is stable during the time from the LOW-to-HIGH transition of $\overline{RESET}$ until the input receivers are fully enabled, the design of the SSTUH32866 must ensure that the outputs will remain LOW, thus ensuring no glitches on the output.

7.1 Function table

Table 3: Function table (each flip-flop)

L = LOW voltage level; H = HIGH voltage level; X = don't care; ↑ = LOW-to-HIGH transition; ↓ = HIGH-to-LOW transition

Inputs						Outputs [1]		
$\overline{RESET}$	$\overline{DCS}$	$\overline{CSR}$	CK	$\overline{CK}$	Dn, DODTn, DCKEn	Qn	$\overline{QCS}$	QODT, QCKE
H	L	L	↑	↓	L	L	L	L
H	L	L	↑	↓	H	H	L	H
H	L	L	L or H	L or H	X	Q_0	Q_0	Q_0
H	L	H	↑	↓	L	L	L	L
H	L	H	↑	↓	H	H	L	H
H	L	H	L or H	L or H	X	Q_0	Q_0	Q_0
H	H	L	↑	↓	L	L	H	L
H	H	L	↑	↓	H	H	H	H
H	H	L	L or H	L or H	X	Q_0	Q_0	Q_0
H	H	H	↑	↓	L	Q_0	H	L
H	H	H	↑	↓	H	Q_0	H	H
H	H	H	L or H	L or H	X	Q_0	Q_0	Q_0
L	X or floating	X or floating	X or floating	X or floating	X or floating	L	L	L

[1] Q_0 is the previous state of the associated output.

Table 4: Parity and standby function table

L = LOW voltage level; H = HIGH voltage level; X = don't care; ↑ = LOW-to-HIGH transition; ↓ = HIGH-to-LOW transition

Inputs							Outputs [1]	
$\overline{RESET}$	$\overline{DCS}$	$\overline{CSR}$	CK	$\overline{CK}$	Σ of inputs = H (D1 to D25)	PAR_IN [2]	PPO [3]	$\overline{QERR}$ [4]
H	L	X	↑	↓	even	L	L	H
H	L	X	↑	↓	odd	L	H	L
H	L	X	↑	↓	even	H	H	L
H	L	X	↑	↓	odd	H	L	H
H	H	L	↑	↓	even	L	L	H
H	H	L	↑	↓	odd	L	H	L
H	H	L	↑	↓	even	H	H	L
H	H	L	↑	↓	odd	H	L	H
H	H	H	↑	↓	X	X	PPO_0	$\overline{QERR}_0$
H	X	X	L or H	L or H	X	X	PPO_0	$\overline{QERR}_0$
L	X or floating	X or floating	X or floating	X or floating	X or floating	X or floating	L	H

[1] PPO_0 is the previous state of output PPO; $\overline{QERR}_0$ is the previous state of output $\overline{QERR}$.

[2] Data inputs = D2, D3, D5, D6, D8 to D25 when C0 = 0 and C1 = 0.
Data inputs = D2, D3, D5, D6, D8 to D14 when C0 = 0 and C1 = 1.
Data inputs = D1 to D6, D8 to D10, D12, D13 when C0 = 1 and C1 = 1.

[3] PAR_IN arrives one clock cycle (C0 = 0), or two clock cycles (C0 = 1), after the data to which it applies.

[4] This condition assumes $\overline{QERR}$ is HIGH at the crossing of CK going HIGH and $\overline{CK}$ going LOW. If $\overline{QERR}$ is LOW, it stays latched LOW for two clock cycles or until $\overline{RESET}$ is driven LOW.

8. Limiting values

Table 5: Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DD}	supply voltage		–0.5	+2.5	V
V_I	receiver input voltage		–0.5 [1]	+2.5 [2]	V
V_O	driver output voltage		–0.5 [1]	V_{DD} + 0.5 [2]	V
I_{IK}	input clamp current	$V_I < 0$ V or $V_I > V_{DD}$	-	–50	mA
I_{OK}	output clamp current	$V_O < 0$ V or $V_O > V_{DD}$	-	±50	mA
I_O	continuous output current	0 V < V_O < V_{DD}	-	±50	mA
I_{CCC}	continuous current through each V_{DD} or GND pin		-	±100	mA
T_{stg}	storage temperature		–65	+150	°C
V_{esd}	electrostatic discharge voltage	Human Body Model (HBM); 1.5 kΩ; 100 pF	2	-	kV
		Machine Model (MM); 0 Ω; 200 pF	200	-	V

[1] The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

[2] This value is limited to 2.5 V maximum.

9. Recommended operating conditions

Table 6: Recommended operating conditions

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
V_{DD}	supply voltage			1.7	-	1.9	V
V_{ref}	reference voltage			0.49 × V_{DD}	0.50 × V_{DD}	0.51 × V_{DD}	V
V_{TT}	termination voltage			V_{ref} – 0.040	V_{ref}	V_{ref} + 0.040	V
V_I	input voltage			0	-	V_{DD}	V
$V_{IH(AC)}$	AC HIGH-level input voltage	data (Dn), $\overline{CSR}$, and PAR_IN inputs		V_{ref} + 0.250	-	-	V
$V_{IL(AC)}$	AC LOW-level input voltage	data (Dn), $\overline{CSR}$, and PAR_IN inputs		-	-	V_{ref} – 0.250	V
$V_{IH(DC)}$	DC HIGH-level input voltage	data (Dn), $\overline{CSR}$, and PAR_IN inputs		V_{ref} + 0.125	-	-	V
$V_{IL(DC)}$	DC LOW-level input voltage	data (Dn), $\overline{CSR}$, and PAR_IN inputs		-	-	V_{ref} – 0.125	V
V_{IH}	HIGH-level input voltage	$\overline{RESET}$, Cn	[1]	0.65 × V_{DD}	-	-	V
V_{IL}	LOW-level input voltage	$\overline{RESET}$, Cn	[1]	-	-	0.35 × V_{DD}	V
V_{ICR}	common mode input voltage range	CK, $\overline{CK}$	[2]	0.675	-	1.125	V
V_{ID}	differential input voltage	CK, $\overline{CK}$	[2]	600	-	-	mV

Table 6: Recommended operating conditions *...continued*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I_{OH}	HIGH-level output current		-	-	–12	mA
I_{OL}	LOW-level output current		-	-	12	mA
T_{amb}	ambient temperature	operating in free air	0	-	+70	°C

[1] The $\overline{RESET}$ and Cn inputs of the device must be held at valid levels (not floating) to ensure proper device operation.

[2] The differential inputs must not be floating, unless $\overline{RESET}$ is LOW.

10. Characteristics

Table 7: Characteristics

At recommended operating conditions (see Table 6), unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{OH}	HIGH-level output voltage	I_{OH} = –12 mA; V_{DD} = 1.7 V	1.2	-	-	V
V_{OL}	LOW-level output voltage	I_{OL} = 12 mA; V_{DD} = 1.7 V	-	-	0.5	V
I_I	input current	all inputs; $V_I = V_{DD}$ or GND; V_{DD} = 1.9 V	-	-	±5	µA
I_{DD}	static standby current	$\overline{RESET}$ = GND; I_O = 0 mA; V_{DD} = 1.9 V	-	-	100	µA
	static operating current	$\overline{RESET} = V_{DD}$; I_O = 0 mA; V_{DD} = 1.9 V; $V_I = V_{IH(AC)}$ or $V_{IL(AC)}$	-	-	40	mA
I_{DDD}	dynamic operating current per MHz, clock only	$\overline{RESET} = V_{DD}$; $V_I = V_{IH(AC)}$ or $V_{IL(AC)}$; CK and $\overline{CK}$ switching at 50 % duty cycle. I_O = 0 mA; V_{DD} = 1.8 V	-	16	-	µA
	dynamic operating current per MHz, per each data input, 1 : 1 mode	$\overline{RESET} = V_{DD}$; $V_I = V_{IH(AC)}$ or $V_{IL(AC)}$; CK and $\overline{CK}$ switching at 50 % duty cycle. One data input switching at half clock frequency, 50 % duty cycle. I_O = 0 mA; V_{DD} = 1.8 V	-	11	-	µA
	dynamic operating current per MHz, per each data input, 1 : 2 mode	$\overline{RESET} = V_{DD}$; $V_I = V_{IH(AC)}$ or $V_{IL(AC)}$; CK and $\overline{CK}$ switching at 50 % duty cycle. One data input switching at half clock frequency, 50 % duty cycle. I_O = 0 mA; V_{DD} = 1.8 V	-	19	-	µA
C_i	input capacitance, data and $\overline{CSR}$ inputs	$V_I = V_{ref} \pm 250$ mV; V_{DD} = 1.8 V	2.5	-	3.5	pF
	input capacitance, CK and $\overline{CK}$ inputs	V_{ICR} = 0.9 V; $V_{i(p-p)}$ = 600 mV; V_{DD} = 1.8 V	2	-	3	pF
	input capacitance, $\overline{RESET}$ input	$V_I = V_{DD}$ or GND; V_{DD} = 1.8 V	3	-	4	pF

Table 8: Timing requirements

At recommended operating conditions (see Table 6), unless otherwise specified. See Figure 2.

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
f_{clock}	clock frequency			-	-	450	MHz
t_W	pulse duration, CK, $\overline{CK}$ HIGH or LOW			1	-	-	ns
t_{ACT}	differential inputs active time		[1] [2]	-	-	10	ns
t_{INACT}	differential inputs inactive time		[1] [3]	-	-	15	ns
t_{su}	setup time	$\overline{DCS}$ before CK↑, $\overline{CK}$↓, $\overline{CSR}$ HIGH; $\overline{CSR}$ before CK↑, $\overline{CK}$↓, $\overline{DCS}$ HIGH		0.7	-	-	ns
		$\overline{DCS}$ before CK↑, $\overline{CK}$↓, $\overline{CSR}$ LOW		0.5	-	-	ns
		DODT, DCKE and data (Dn) before CK↑, $\overline{CK}$↓		0.5	-	-	ns
		PAR_IN before CK↑, $\overline{CK}$↓		0.5	-	-	ns
t_h	hold time	DCS, DODT, DCKE and data (Dn) after CK↑, $\overline{CK}$↓		0.5	-	-	ns
		PAR_IN after CK↑, $\overline{CK}$↓		0.5	-	-	ns

[1] This parameter is not necessarily production tested.

[2] VREF must be held at a valid input voltage level and data inputs must be held LOW for a minimum time of $t_{ACT(max)}$ after $\overline{RESET}$ is taken HIGH.

[3] VREF, data and clock inputs must be held at valid levels (not floating) a minimum time of $t_{INACT(max)}$ after $\overline{RESET}$ is taken LOW.

Table 9: Switching characteristics

At recommended operating conditions (see Table 6), unless otherwise specified. See Section 11.1.

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
f_{MAX}	maximum input clock frequency			450	-	-	MHz
t_{PDM}	propagation delay, single bit switching	from CK↑ and $\overline{CK}$↓ to Qn	[1]	1.41	-	1.8	ns
t_{PD}	propagation delay	from CK↑ and $\overline{CK}$↓ to PPO		0.5	-	1.8	ns
t_{LH}	LOW-to-HIGH propagation delay	from CK↑ and $\overline{CK}$↓ to $\overline{QERR}$		1.2	-	3	ns
t_{HL}	HIGH-to-LOW propagation delay	from CK↑ and $\overline{CK}$↓ to $\overline{QERR}$		1	-	2.4	ns
t_{PDMSS}	propagation delay, simultaneous switching	from CK↑ and $\overline{CK}$↓ to Qn	[1] [2]	-	-	2.0	ns
t_{PHL}	HIGH-to-LOW propagation delay	from $\overline{RESET}$↓ to Qn↓		-	-	3	ns
		from $\overline{RESET}$↓ to PPO↓		-	-	3	ns
t_{PLH}	LOW-to-HIGH propagation delay	from $\overline{RESET}$↓ to $\overline{QERR}$↑		-	-	3	ns

[1] Includes 350 ps of test-load transmission line delay.

[2] This parameter is not necessarily production tested.

Table 10: Data output edge rates

At recommended operating conditions (see Table 6), unless otherwise specified. See Section 11.2.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
dV/dt_r	rising edge slew rate	from 20 % to 80 %	1	-	4	V/ns
dV/dt_f	falling edge slew rate	from 80 % to 20 %	1	-	4	V/ns
dV/dt_Δ	absolute difference between dV/dt_r and dV/dt_f	from 20 % or 80 % to 80 % or 20 %	-	-	1	V/ns

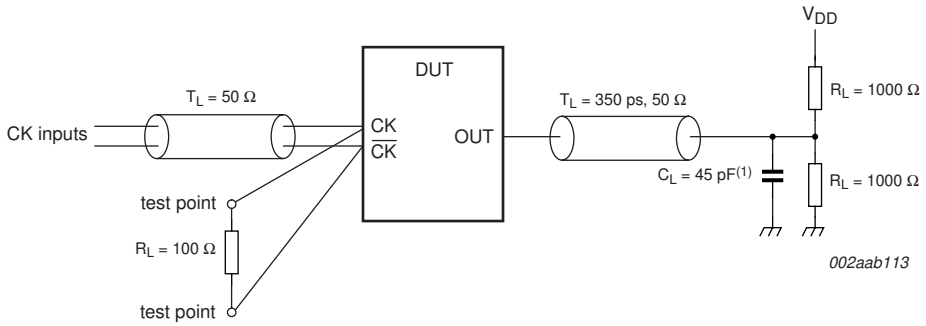
11. Test information

11.1 Parameter measurement information for data output load circuit

V_{DD} = 1.8 V ± 0.1 V.

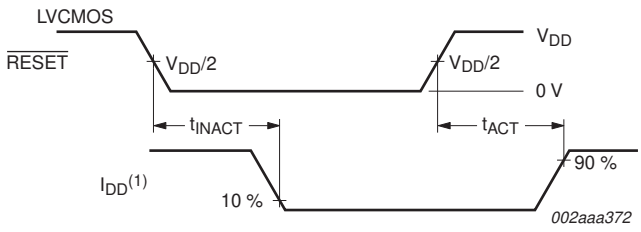
All input pulses are supplied by generators having the following characteristics: PRR ≤ 10 MHz; Z_0 = 50 Ω; input slew rate = 1 V/ns ± 20 %, unless otherwise specified.

The outputs are measured one at a time with one transition per measurement.



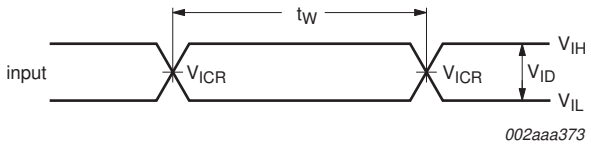
(1) C_L includes probe and jig capacitance.

Fig 10. Load circuit, data output measurements



(1) I_{DD} tested with clock and data inputs held at V_{DD} or GND, and I_O = 0 mA.

Fig 11. Voltage and current waveforms; inputs active and inactive times

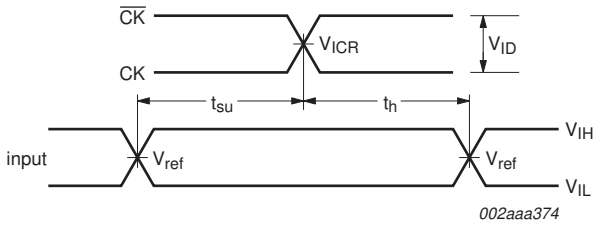


V_{ID} = 600 mV

$V_{IH} = V_{ref}$ + 250 mV (AC voltage levels) for differential inputs. $V_{IH} = V_{DD}$ for LVCMOS inputs.

$V_{IL} = V_{ref}$ – 250 mV (AC voltage levels) for differential inputs. V_{IL} = GND for LVCMOS inputs.

Fig 12. Voltage waveforms; pulse duration



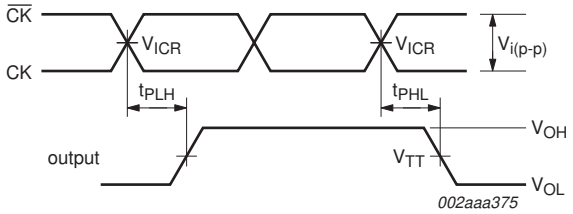
V_{ID} = 600 mV

$V_{ref} = V_{DD}/2$

$V_{IH} = V_{ref}$ + 250 mV (AC voltage levels) for differential inputs. $V_{IH} = V_{DD}$ for LVCMOS inputs.

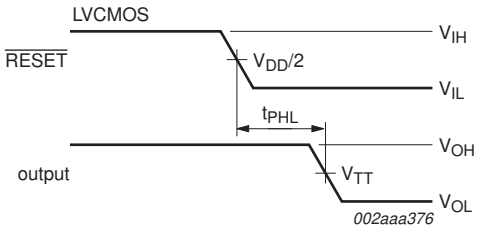
$V_{IL} = V_{ref}$ – 250 mV (AC voltage levels) for differential inputs. V_{IL} = GND for LVCMOS inputs.

Fig 13. Voltage waveforms; setup and hold times



t_{PLH} and t_{PHL} are the same as t_{PD}.

Fig 14. Voltage waveforms; propagation delay times (clock to output)



t_{PLH} and t_{PHL} are the same as t_{PD}.

$V_{IH} = V_{ref}$ + 250 mV (AC voltage levels) for differential inputs. $V_{IH} = V_{DD}$ for LVCMOS inputs.

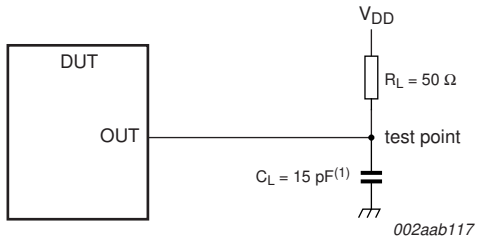
$V_{IL} = V_{ref}$ – 250 mV (AC voltage levels) for differential inputs. V_{IL} = GND for LVCMOS inputs.

Fig 15. Voltage waveforms; propagation delay times (reset to output)

11.2 Data output slew rate measurement information

V_{DD} = 1.8 V ± 0.1 V.

All input pulses are supplied by generators having the following characteristics:
PRR ≤ 10 MHz; Z_0 = 50 Ω; input slew rate = 1 V/ns ± 20 %, unless otherwise specified.



(1) C_L includes probe and jig capacitance.

13. Soldering

13.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

13.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 °C to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
  - for all BGA, HTSSON..T and SSOP..T packages
  - for packages with a thickness ≥ 2.5 mm
  - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm^3 so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm^3 so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

13.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;

– smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 seconds to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

13.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 seconds to 5 seconds between 270 °C and 320 °C.

13.5 Package related soldering information

Table 11: Suitability of surface mount IC packages for wave and reflow soldering methods

Package [1]	Soldering method	
	Wave	Reflow [2]
BGA, HTSSON..T [3], LBGA, LFBGA, SQFP, SSOP..T [3], TFBGA, VFBGA, XSON	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable [4]	suitable
PLCC [5], SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended [5] [6]	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended [7]	suitable
CWQCCN..L [8], PMFP [9], WQCCN..L [8]	not suitable	not suitable

[1] For more detailed information on the BGA packages refer to the *(LF)BGA Application Note* (AN01026); order a copy from your Philips Semiconductors sales office.

[2] All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods*.

[3] These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding 217 °C ± 10 °C measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
