

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Address: A1208, Overseas Decoration Building, #122 Zhenhua RD., Futian, Shenzhen, China

## Features

- Complete smartcard interface
- ISO 7816, NDS and EMV 4.3 payment systems compatible
- Three protected half-duplex bidirectional buffered I/O lines to the smartcard
- 5 V, 3 V or 1.8 V supply voltage for the smartcard ( $V_{CC}$ ), pin-selectable. Ensures controlled  $V_{CC}$  rise and fall times and provides smart overload detection with glitch immunity.
- Very low power consumption in deep shutdown mode
- Chip select function allows the device interface to be isolated from the microcontroller signals - allows parallel combination of the card interface devices (ST8034HC)
- Card clock generation by integrated crystal oscillator or from external clock source
- Card clock frequency up to 20 MHz, programmable by CLKDIV1 and CLKDIV2 pins (ST8034HN) or by CLKDIV pin (ST8034HC), with synchronous frequency changes

- Automatic activation and deactivation sequences initiated by the microcontroller
- Emergency deactivation sequences initiated by a card supply short-circuit, card take-off, falling  $V_{DD}$ ,  $V_{DDP}$ , or  $V_{DD(INTF)}$  or by the interface device overheating
- Voltage supply supervisors
  - with a fixed threshold ( $V_{DD}$ ,  $V_{DDP}$ )
  - with an external resistor divider to set the  $V_{DD(INTF)}$  threshold (PORADJ pin)
- Multipurpose card status signal  $\overline{OFF}$
- Non-inverted card reset pin RST driven by the RSTIN input
- Thermal and short-circuit protection of all card contacts
- Card presence detection contacts debounced
- Enhanced card side ESD protection of 8 kV
- Space saving QFN24 4 x 4 x 0.8 mm package
- Temperature range -25 to +85 °C

## Applications

Smartcard readers for

- Set-top boxes
- Pay-TV
- Identification
- Banking
- Tachographs

# 1 Description

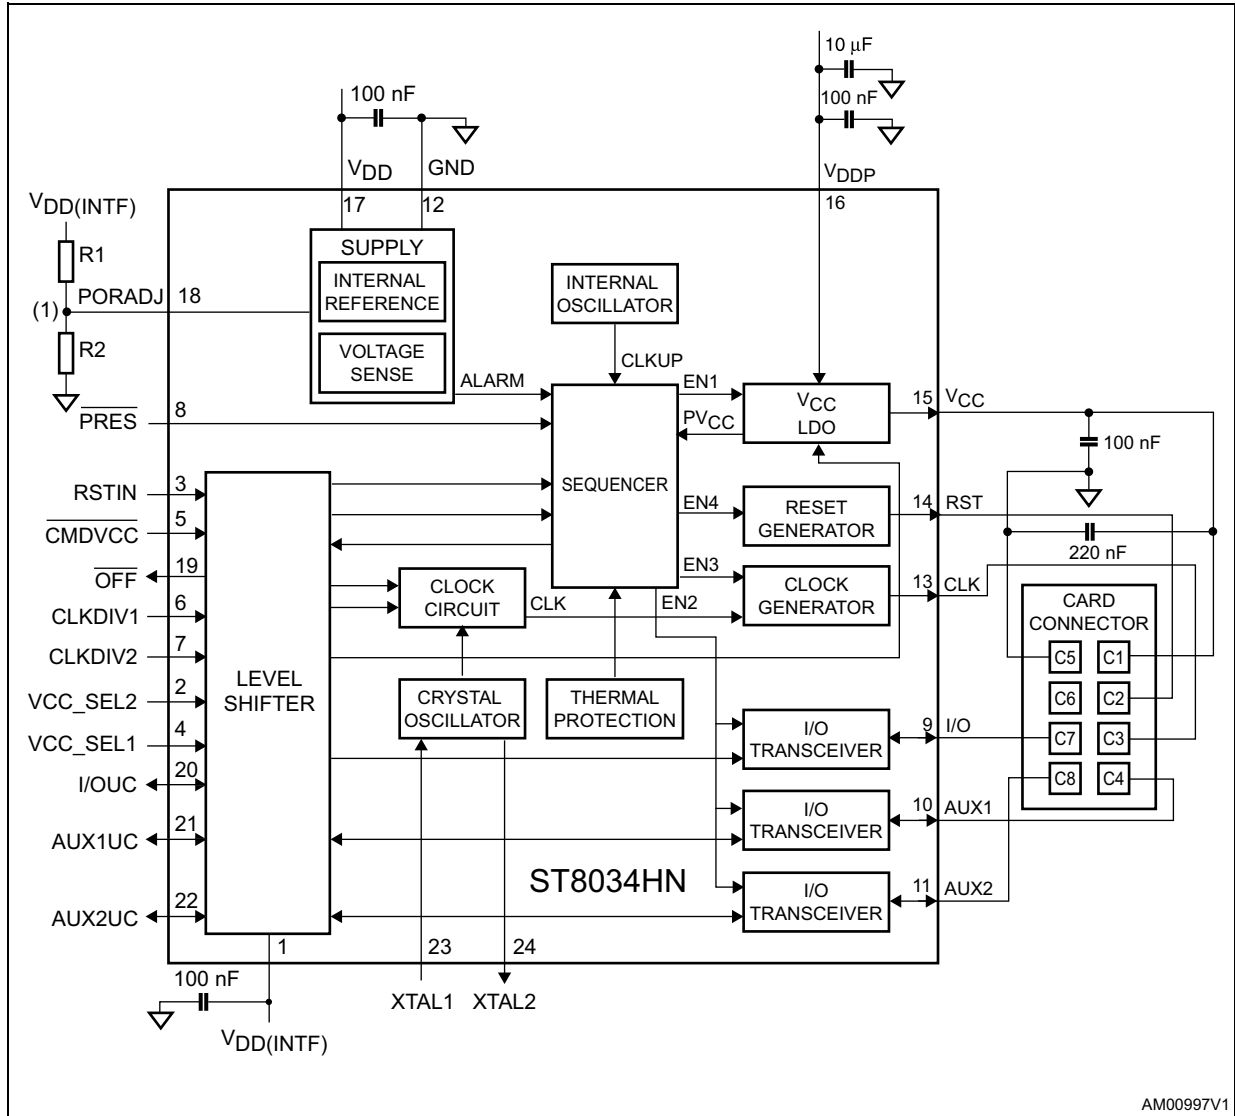

The ST8034HN and ST8034HC devices are complete low-cost analog interfaces for asynchronous and synchronous smartcards operating at a supply voltage of 5 V, 3 V or 1.8 V. The ST8034HN and ST8034HC devices can be placed between the card and the microcontroller to provide all supply, protection, detection and control functions, with just a few external components.

**Table 1. Device summary**

Order code	PORADJ	V <sub>CC</sub> selection pins	Chip select	CLKDIV inputs	NDS compliant	Package	Shipment	Package topmark
ST8034HNQR	✓	✓		2	✓	QFN24 4 x 4 x 0.85 mm, 0.5 mm pitch	Tape and reel	8034HN
ST8034HCQR	✓	✓	✓	1	✓	QFN24 4 x 4 x 0.85 mm, 0.5 mm pitch	Tape and reel	8034HC

## 2 Block diagrams

Figure 1. Block diagram ST8034HN

AM00997V1

- Optional external resistor divider. If not used, connect the PORADJ pin to V<sub>DD</sub>(INTF) for a direct V<sub>DD</sub>(INTF) voltage monitoring.

Figure 2. Block diagram ST8034HC

AM00998V1

- Optional external resistor divider. If not used, connect the PORADJ pin to V<sub>DD(INTF)</sub> for a direct V<sub>DD(INTF)</sub> voltage monitoring.

### 3 Pin description

Figure 3. Pin connections ST8034HN (top-through view)

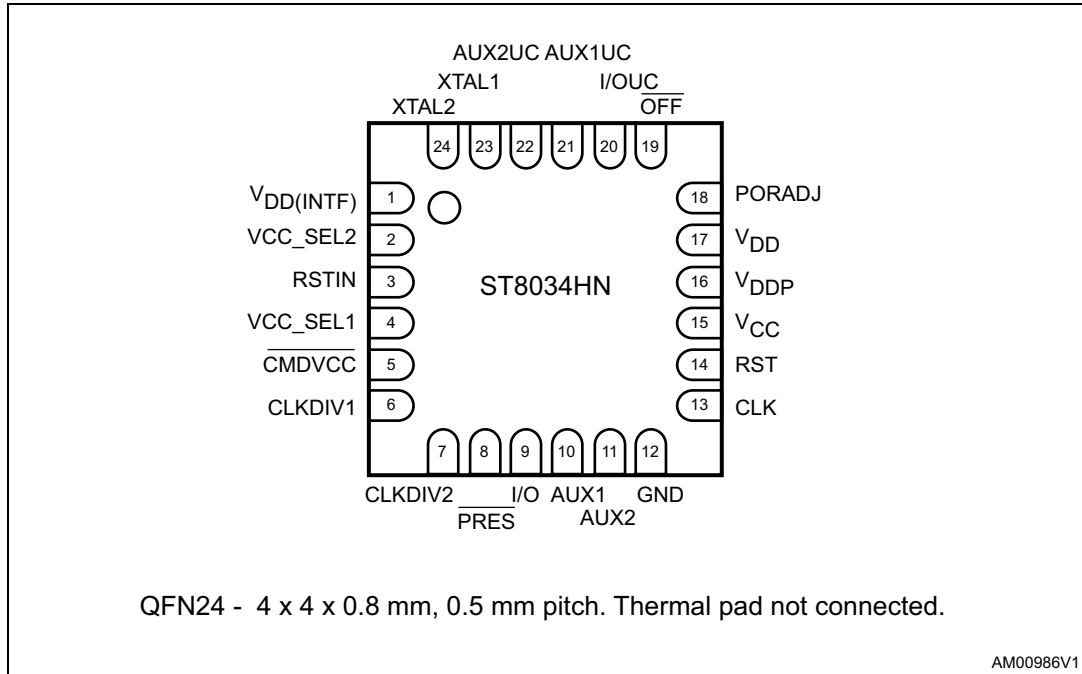

Figure 4. Pin connections ST8034HC (top-through view)

Table 2. Pin description ST8034HN and ST8034HC

Pin number	Symbol	Ref. supply	Function
1	V <sub>DD(INTF)</sub>	V <sub>DD(INTF)</sub>	Microcontroller interface supply voltage
2	VCC_SEL2	V <sub>DD(INTF)</sub>	V <sub>CC</sub> selection control signal 5 V or 3 V (see <a href="#">Table 13 on page 27</a> )
3	RSTIN	V <sub>DD(INTF)</sub>	Card reset input from microcontroller; active high
4	VCC_SEL1	V <sub>DD(INTF)</sub>	V <sub>CC</sub> selection control signal 1.8 V, overrides VCC_SEL2 (see <a href="#">Table 13 on page 27</a> )
5	$\overline{\text{CMDVCC}}$	V <sub>DD(INTF)</sub>	Activation sequence start, input (from microcontroller, active low)
6	CLKDIV1	V <sub>DD(INTF)</sub>	CLK frequency division control input (together with CLKDIV2), see <a href="#">Table 12 on page 21</a> (ST8034HN)
	CS	V <sub>DD(INTF)</sub>	Chip select input. High = device active, low = all microcontroller interface pins in high impedance (ST8034HC)
7	CLKDIV2	V <sub>DD(INTF)</sub>	CLK frequency division control (together with CLKDIV1), see <a href="#">Table 12 on page 21</a> (ST8034HN)
	CLKDIV	V <sub>DD(INTF)</sub>	CLK frequency division control, see <a href="#">Table 12 on page 21</a> (ST8034HC)
8	$\overline{\text{PRES}}$	V <sub>DD(INTF)</sub>	Card presence input (active low: $\overline{\text{PRES}}$ low = card is present). Debounced.
9	I/O	V <sub>CC</sub>	Card input/output data line (C7); internal 9 k $\Omega$ pull-up resistor to V <sub>CC</sub>
10	AUX1	V <sub>CC</sub>	Auxiliary card input/output data line (C4); internal 9 k $\Omega$ pull-up resistor to V <sub>CC</sub>
11	AUX2	V <sub>CC</sub>	Auxiliary card input/output data line (C8); internal 9 k $\Omega$ pull-up resistor to V <sub>CC</sub>
12	GND		Ground
13	CLK	V <sub>CC</sub>	Clock to card (C3)
14	RST	V <sub>CC</sub>	Card reset, output (C2)
15	V <sub>CC</sub>		Supply voltage for the card, output (C1)
16	V <sub>DDP</sub>		LDO supply voltage input (for V <sub>CC</sub> generation)
17	V <sub>DD</sub>		Control logic supply voltage input
18	PORADJ	V <sub>DD(INTF)</sub>	Power-on reset threshold adjustment input (with an optional external resistor divider)
19	$\overline{\text{OFF}}$	V <sub>DD(INTF)</sub>	Interrupt to microcontroller (active low output); internal 20 k $\Omega$ pull-up resistor to V <sub>DD(INTF)</sub>
20	I/OUC	V <sub>DD(INTF)</sub>	Microcontroller data I/O line (with internal 10 k $\Omega$ pull-up resistor connected to V <sub>DD(INTF)</sub> )
21	AUXUC1	V <sub>DD(INTF)</sub>	Auxiliary microcontroller input/output data line; internal 10 k $\Omega$ pull-up resistor to V <sub>DD(INTF)</sub>
22	AUXUC2	V <sub>DD(INTF)</sub>	Auxiliary microcontroller input/output data line; internal 10 k $\Omega$ pull-up resistor to V <sub>DD(INTF)</sub>
23	XTAL1	V <sub>DD</sub>	Crystal or external clock input
24	XTAL2	V <sub>DD</sub>	Crystal connection (leave this pin open if external clock is used)

## 4 Maximum ratings

**Table 3. Absolute maximum ratings<sup>(1), (2)</sup>**

Symbol	Parameter	Min.	Max.	Unit
V <sub>DD</sub>	Supply voltage, logic	-0.3	6	V
V <sub>DDP</sub>	Supply voltage, power	-0.3	6	V
V <sub>DD(INTF)</sub>	Supply voltage, interface	-0.3	6	V
V <sub>IN</sub>	Input voltage on XTAL1, XTAL2, RSTIN, I/OUC, AUX1UC, AUX2UC, CLKDIV1, CLKDIV2, CS, VCC_SEL1, VCC_SEL2, PORADJ, CMDVCC, OFF, PRES, I/O, AUX1, and AUX2 pins	-0.3	6	V
V <sub>ESD (HBM)</sub>	Human body model (HBM) on card lines - I/O, RST, V <sub>CC</sub> , CLK, and PRES pins	-8	8	kV
	Human body model (HBM), all other pins	-2	2	kV
V <sub>ESD (MM)</sub>	Machine model (MM), all pins	-200	200	V
V <sub>ESD (FCDM)</sub>	Field charged device model (FCDM), all pins	-500	500	V
P <sub>TOT</sub>	Total power dissipation (T <sub>A</sub> = -25 to +85 °C)		0.25	W
T <sub>J(MAX)</sub>	Maximum operating junction temperature		125	°C
T <sub>STG</sub>	Storage temperature range	-55	150	°C

1. Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.
2. All card contacts are protected against short-circuit to any other card contact.

**Table 4. Thermal data**

Symbol	Parameter	Test conditions	Typ.	Unit
R <sub>THJA</sub>	Thermal resistance junction-ambient temperature (multilayer test board - JEDEC standard)	QFN24	47	°C/W

**Table 5. Recommended operating conditions**

Symbol	Parameter	Test conditions	Min.	Max.	Unit
T <sub>A</sub>	Ambient temperature range		-25	85	°C

## 5 Electrical characteristics

### Electrical characteristics over recommended operating conditions

Table 6. Supply voltages

Symbol	Parameter	Test conditions <sup>(1)</sup>	Min.	Typ.	Max.	Unit	
<b>Device supply voltages</b>							
V <sub>DD</sub>	Supply voltage, logic		2.7	3.3	3.6 <sup>(2)</sup>	V	
V <sub>DDP</sub>	Supply voltage, power	V <sub>CC</sub> = 5 V	4.85	5	5.5	V	
		V <sub>CC</sub> = 3 V or 1.8 V	3	3.3	5.5		
V <sub>DD(INTF)</sub>	Supply voltage, microcontroller interface		1.6	3.3	V <sub>DD</sub> + 0.3 <sup>(3)</sup>	V	
I <sub>DD</sub>	Supply current, logic	Shutdown mode			35	μA	
		Deep shutdown mode			12		
		Active mode			2		mA
I <sub>DDP</sub>	Supply current, power	Shutdown mode, f <sub>XTAL</sub> stopped			5	μA	
		Active mode, f <sub>CLK</sub> = f <sub>XTAL</sub> /2, no I <sub>CC</sub> load			1.5		mA
		Active mode, f <sub>CLK</sub> = f <sub>XTAL</sub> /2, I <sub>CC</sub> = 65 mA			70		
I <sub>DD(INTF)</sub>	Supply current, interface	Shutdown mode			6	μA	
		Active mode			2	mA	
<b>Card supply voltage</b>							
V <sub>CC</sub>	Card supply voltage (output) <sup>(4)</sup>	Active mode, V <sub>CC</sub> = 5 V, I <sub>CC</sub> < 65 mA	4.75	5.0	5.25	V	
		With current pulses of 40 nAs at I <sub>CC</sub> < 200 mA, t < 400 ns <sup>(5)</sup>	4.65	5.0	5.25		
		Active mode, V <sub>CC</sub> = 3 V, I <sub>CC</sub> < 65 mA	2.85	3.05	3.15		
		With current pulses of 40 nAs at I <sub>CC</sub> < 200 mA, t < 400 ns <sup>(5)</sup>	2.76		3.20		
		Active mode, V <sub>CC</sub> = 1.8 V, I <sub>CC</sub> < 65 mA	1.71	1.83	1.89		
		With current pulses of 15 nAs at I <sub>CC</sub> < 200 mA, t < 400 ns <sup>(5)</sup>	1.66		1.94		
I <sub>CC</sub>	Card supply current (refer also to <a href="#">Table 10: Protection characteristics on page 17</a> )	V <sub>CC</sub> = 5 V, 3 V or 1.8 V			65	mA	
		V <sub>CC</sub> shorted to GND	90	120	150		
C <sub>VCC</sub>	V <sub>CC</sub> decoupling capacitor <sup>(4)</sup>	V <sub>CC</sub> to GND	160	320	530	nF	
SR	V <sub>CC</sub> slew rate (rising or falling) <sup>(4)</sup>	V <sub>CC</sub> = 5 V	0.055	0.180	0.300	V/μs	
		V <sub>CC</sub> = 3 V	0.040	0.180	0.300		
		V <sub>CC</sub> = 1.8 V	0.025	0.180	0.300		

Table 6. Supply voltages (continued)

Symbol	Parameter	Test conditions <sup>(1)</sup>	Min.	Typ.	Max.	Unit
V <sub>CC(SHDN)</sub>	V <sub>CC</sub> output voltage in shutdown mode	No load	-0.1		0.1	V
		I <sub>CC</sub> = 1 mA	-0.1		0.3	
I <sub>CC(SHDN)</sub>	V <sub>CC</sub> output current in shutdown mode	V <sub>CC</sub> connected to GND			-1	mA
<b>Device supply voltages monitoring</b>						
V <sub>TH</sub>	Falling supply voltage threshold	V <sub>DD</sub> pin	2.3	2.4	2.5	V
		V <sub>DDP</sub> pin (V <sub>CC</sub> = 5 V)	3.0	4.1	4.4	
		V <sub>DDP</sub> pin (V <sub>CC</sub> = 3 V or 1.8 V)	2.3	2.4	2.5	
		PORADJ pin	1.20	1.24	1.29	
V <sub>HYS</sub>	Hysteresis on supply voltage threshold	V <sub>DD</sub> pin	50	100	150	mV
		V <sub>DDP</sub> pin (V <sub>CC</sub> = 5 V)	100	200	350	
		V <sub>DDP</sub> pin (V <sub>CC</sub> = 3 V or 1.8 V)	50	100	150	
		PORADJ pin	10	20	30	
I <sub>I(PORADJ)</sub>	Input current, PORADJ pin		-1		1	μA
t <sub>W</sub>	Power-on or undervoltage reset pulse width (minimum)		5.1	8	10.2	ms

1. T<sub>A</sub> = 25 °C, V<sub>DD</sub> = 3.3 V, V<sub>DDP</sub> = 5 V, V<sub>DD(INTF)</sub> = 3.3 V, f<sub>XTAL</sub> = 10 MHz, unless otherwise noted.
2. The device can operate at V<sub>DD</sub> supply voltage up to 5.5 V, however the specified parameters (mainly related to current consumption) are guaranteed in the basic V<sub>DD</sub> range 2.7 to 3.6 V.
3. The device can operate at V<sub>DD(INTF)</sub> supply voltage up to 5.5 V, however the specified parameters (mainly related to current consumption and input currents) are guaranteed in the basic V<sub>DD(INTF)</sub> range 1.6 to 3.6 V.
4. Two low ESR (< 350 mΩ) ceramic capacitors for V<sub>CC</sub> decoupling recommended: 100 nF ± 20% (up to 330 nF ± 20%) close to the ST8034 and 100 nF ± 20% (up to 330 nF ± 20%) close to the card.
5. These current pulses are filtered by the decoupling capacitors on the V<sub>CC</sub> pin, therefore for the LDO just the mean value matters.

Table 7. Card interface

Symbol	Parameter	Test conditions <sup>(1)</sup>	Min.	Typ.	Max.	Unit
<b>Data lines to the card (I/O, AUX1, AUX2 pins)<sup>(2)</sup></b>						
$t_D$	Delay time	Falling edge on pin I/O to falling edge on I/OUC or vice versa			200	ns
$t_{W(PU)}$	Pull-up pulse width		100		400	ns
$f_{IO}$	Input/output frequency				1	MHz
$C_I$	Input capacitance				10	pF
$V_O$	Output voltage in shutdown mode	No load	0		0.1	V
		$I_O = 1 \text{ mA}$	0		0.3	V
$I_O$	Output current in shutdown mode	I/O connected to GND			-1	mA
$V_{OL}$	Output voltage low	$I_{OL} = 1 \text{ mA}$	0		0.3	V
		$I_{OL} \geq 15 \text{ mA}$ (current limit)	$V_{CC} - 0.4$		$V_{CC}$	V

Duty cycle (DC) = t<sub>1</sub> / (t<sub>1</sub> + t<sub>2</sub>).

## 6 Functional description

Throughout this document it is assumed that the reader is familiar with ISO7816 terminology.

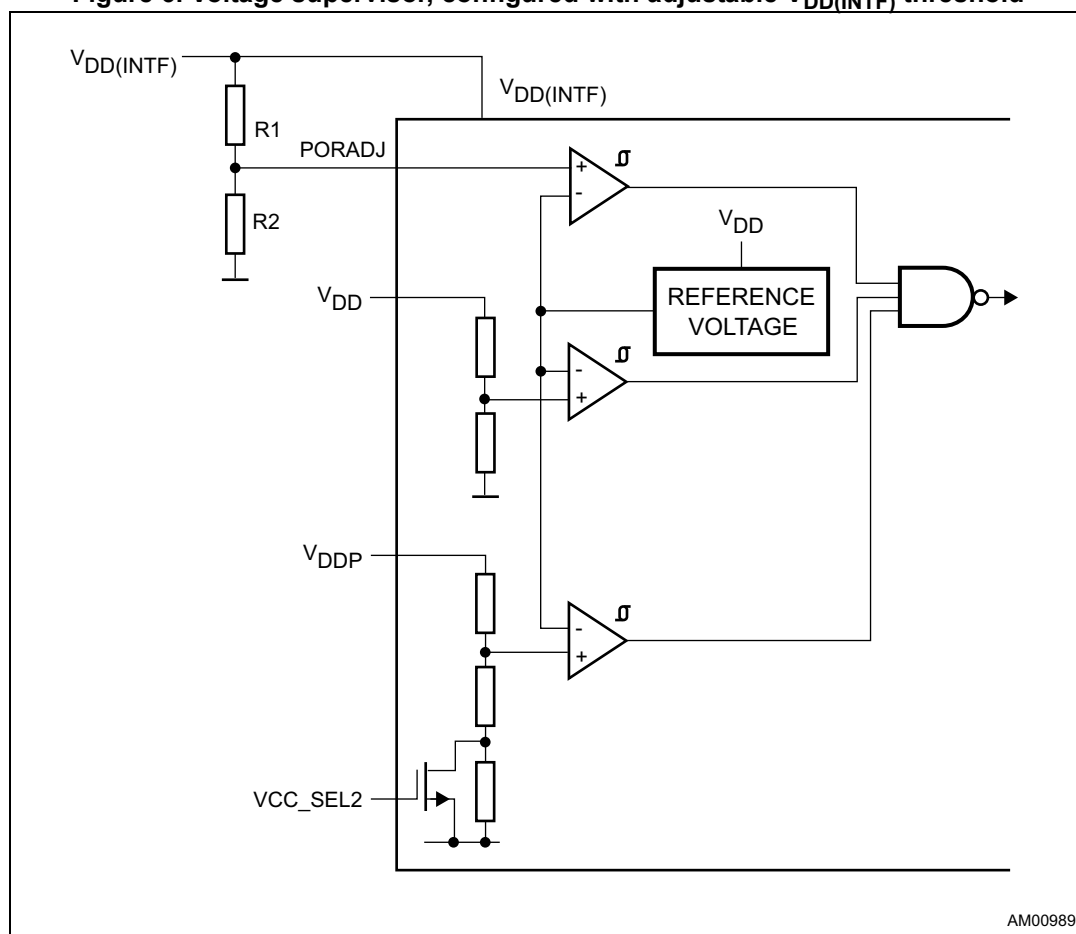

### 6.1 Power supplies

All interface signals to the host microcontroller are referenced to  $V_{DD(INTF)}$ . All card contacts remain inactive during power-up or power-down. After powering up the device,  $\overline{OFF}$  output remains low until  $\overline{CMDVCC}$  input is set high and  $\overline{PRES}$  input is low. During power-down,  $\overline{OFF}$  output goes low when  $V_{DDP}$  falls below the  $V_{DDP}$  falling threshold voltage. The internal oscillator clock frequency  $f_{OSC(INT)}$  is used only during the activation sequence. When the card is not activated ( $\overline{CMDVCC}$  input is high), the internal oscillator is in low frequency mode to reduce power consumption.

Power-on sequence: supply voltages may be applied to the ST8034 in any sequence.

### 6.2 Voltage supervisor

Figure 6. Voltage supervisor, configured with adjustable  $V_{DD(INTF)}$  threshold

The voltage supervisor monitors the  $V_{DDP}$ ,  $V_{DD}$ , and  $V_{DD(INTF)}$  voltages and provides both power-on reset (POR) and supply dropout detection during a card session. The supervisor threshold voltages for  $V_{DDP}$  and  $V_{DD}$  are set internally, and  $V_{DD(INTF)}$  is set externally by an external resistor divider on the PORADJ pin, which provides additional voltage monitoring flexibility (this pin can be used for monitoring any external voltage, with adjustable threshold):

Undervoltage (UVLO) threshold adjustment on the PORADJ input with the resistor divider:

$$V_{DD(INTF)} \text{ UVLO threshold (falling)} = (R1+R2)/R2 \times V_{TH(PORADJ)}$$

$$V_{DD(INTF)} \text{ UVLO threshold (rising)} = (R1+R2)/R2 \times (V_{TH(PORADJ)} + V_{HYST(PORADJ)})$$

If the external resistor divider is not used, connect the PORADJ pin to  $V_{DD(INTF)}$ , then  $V_{DD(INTF)} \text{ UVLO threshold} = V_{TH(PORADJ)}$ .

As long as  $V_{DDP}$ ,  $V_{DD}$  or  $V_{DD(INTF)}$  is less than the corresponding  $V_{TH} + V_{HYS}$ , the device remains inactive irrespective of the command line levels. After  $V_{DDP}$ ,  $V_{DD}$ , and  $V_{DD(INTF)}$  has reached a level higher than the corresponding  $V_{TH} + V_{HYS}$ , the device still remains inactive for the duration of  $t_W$ , a defined reset pulse of approximately 8 ms ( $t_W = 1024 \times 1/f_{OSC(INT)LOW}$ ) when the output of the supervisor keeps the control logic in reset state. This is used to maintain the device in shutdown mode during the supply voltage power-on, see [Figure 7](#). A deactivation sequence is performed when either  $V_{DD}$ ,  $V_{DDP}$  or  $V_{DD(INTF)}$  falls below the corresponding  $V_{TH}$ .

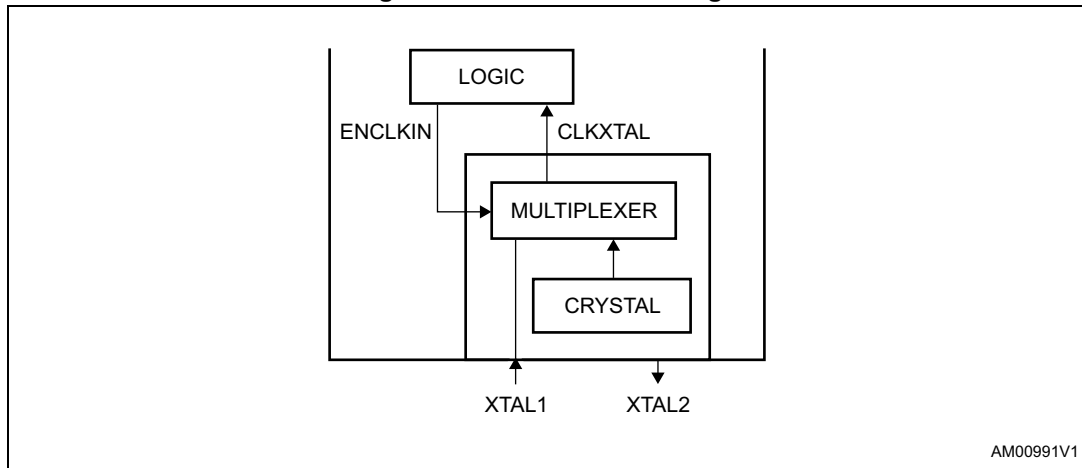

Figure 7. Voltage supervisor waveforms

### 6.3 Clock circuits

The clock signal for the card (CLK output) is either provided by an external clock signal connected to the XTAL1 pin or generated by a crystal connected between the XTAL1 and XTAL2 pins. The ST8034 automatically detects if an external clock is connected to XTAL1, which eliminates the need for a separate clock source selection pin. Automatic clock source detection is performed on each activation command (falling edge of  $\overline{CMDVCC}$ ). The presence of an external clock on the XTAL1 pin is checked during a time window defined by the internal oscillator. If the external clock is detected, the crystal oscillator is stopped. If the clock is not detected, the crystal oscillator is started. When the external clock is used, the clock signal must be present on the XTAL1 pin before the  $\overline{CMDVCC}$  falling edge. If the external clock is used, connect it to XTAL1 input and leave the XTAL2 pin floating. The XTAL1 pin can not be left floating, either a crystal or an external clock source needs to be connected, or the XTAL1 pin needs to be grounded.

Figure 8. External clock usage

AM00991V1

The clock frequency is selected by the CLKDIV1 and CLKDIV2 pins and is  $f_{XTAL}$ ,  $f_{XTAL}/2$ ,  $f_{XTAL}/4$  or  $f_{XTAL}/8$  in the case of the ST8034HN or either  $f_{XTAL}$  or  $f_{XTAL}/2$  in the case of the ST8034HC, selected by the CLKDIV pin, see [Table 12](#).

The frequency change is synchronous, meaning that after transition on the CLKDIV input, the present clock period is completed and after that the new whole clock period starts, therefore no clock period is shortened during the frequency switchover.

If an external crystal is used, the duty cycle on the CLK pin should be between 45% and 55%. If an external clock is connected to the XTAL1 pin, its duty cycle must be between 48% and 52% so that the CLK output duty cycle is between 45% and 55%.

Table 12. Clock frequency selection

ST8034HN		
CLKDIV1 pin level	CLKDIV2 pin level	CLK frequency
Low	Low	$f_{XTAL}/8$
Low	High	$f_{XTAL}/4$
High	High	$f_{XTAL}/2$
High	Low	$f_{XTAL}$
ST8034HC		
CLKDIV pin level	CLK frequency	
High	$f_{XTAL}/2$	
Low	$f_{XTAL}$	

## 6.4 Input and output circuits

When the I/O and I/OUC pins are pulled high by a 9 kΩ resistor between I/O and  $V_{CC}$  and/or 10 kΩ resistor between I/OUC and  $V_{DD(INTF)}$ , both lines enter the idle state. The I/O pin is referenced to  $V_{CC}$  and the I/OUC pin to  $V_{DD(INTF)}$ , which allows operation at  $V_{CC}$  level different from  $V_{DD(INTF)}$  level.

The first side on which a falling edge occurs becomes the master. An anti-latch circuit disables falling edge detection on the other side, making it the slave. After a time delay  $t_D$ , the logic 0 present on the master side is sent to the slave side. When the master side returns logic 1, the slave side sends logic 1 during time delay ( $t_{W(PU)}$ ). After this sequence, both master and slave sides return to their idle states.

The active pull-up feature (one-shot circuit) ensures fast low to high transitions, making the ST8034 outputs capable of delivering more than 1 mA, up to an output voltage of  $0.9 V_{CC}$ , at a load of 80 pF. At the end of the active pull-up pulse, the output voltage is dependent on the internal pull-up resistor value and load current. The current sent to and received from the card's I/O lines is limited to 15 mA at a maximum frequency of 1 MHz.

## 6.5 Shutdown mode

After a power-on reset, if  $\overline{CMDVCC}$  is high, the ST8034 enters shutdown mode, ensuring only the minimum number of circuits are active while the ST8034 waits for the microcontroller to start a session.

- All card contacts are inactive. The impedance between the contacts and GND is approximately  $200 \Omega$
- I/OUC, AUX1UC, AUX2UC pins are in high impedance with the  $10 \text{ k}\Omega$  pull-up resistor connected to  $V_{DD(INTF)}$
- The voltage generators are stopped
- The voltage supervisor is active
- The internal oscillator runs at its lowest frequency ( $f_{OSC(INT)LOW}$ ).

## 6.6 Deep shutdown mode

When the smartcard reader is inactive, the ST8034HN and ST8034HC enter a deep shutdown mode if the  $\overline{\text{CMDVCC}}$  pin is forced high and the  $\text{VCC\_SEL1}$  and  $\text{VCC\_SEL2}$  pins are low. In deep shutdown mode, all circuits are disabled and the  $\overline{\text{OFF}}$  pin follows the status of the  $\overline{\text{PRES}}$  pin. Changing the status of either  $\overline{\text{CMDVCC}}$ ,  $\text{VCC\_SEL1}$  or  $\text{VCC\_SEL2}$  exits the deep shutdown mode, see [Figure 9](#).

**Figure 9. Shutdown and deep shutdown mode activation and deactivation**

## 6.7 Activation sequence

The following device activation sequence is applied when using an external clock, also see [Figure 10](#):

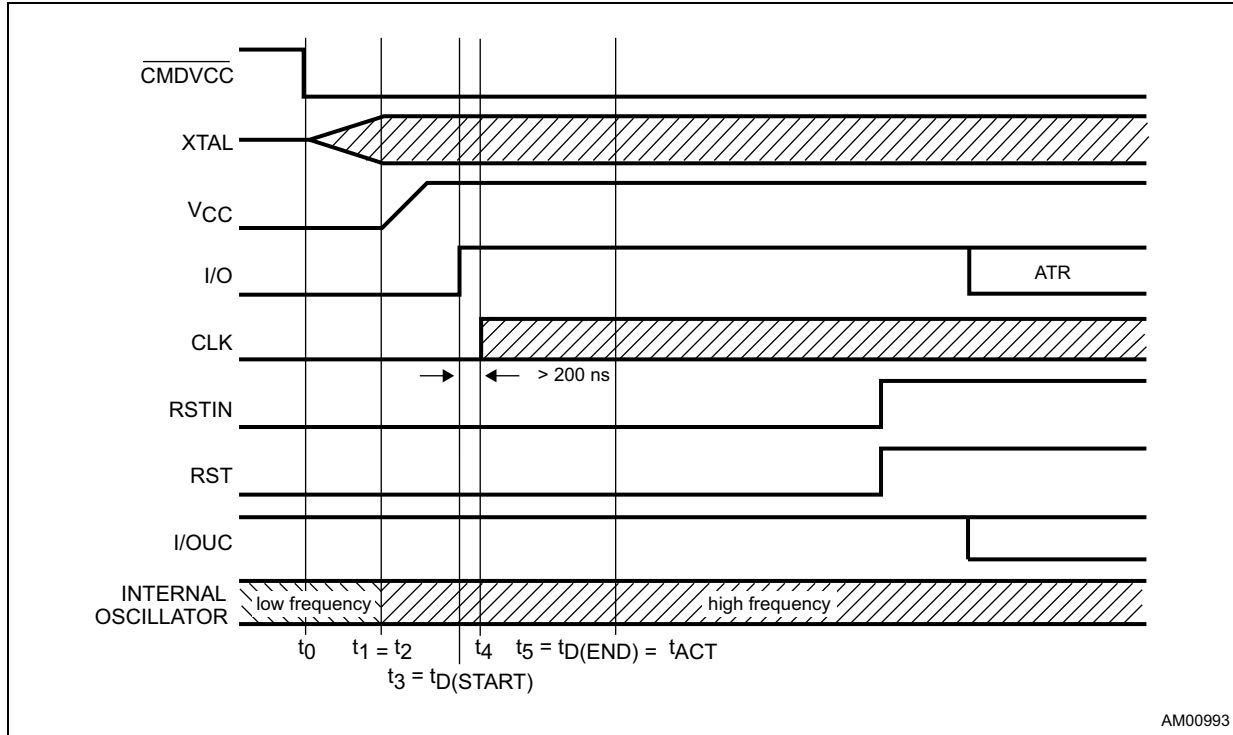

1.  $\overline{\text{CMDVCC}}$  is pulled low ( $t_0$ ).
2. The internal oscillator is triggered ( $t_0$ ).
3. The internal oscillator changes to high frequency ( $t_1$ ).
4.  $\text{VCC}$  rises from 0 V to 1.8 V or to 3 V or to 5 V on a controlled slope ( $t_2$ ).
5. I/O, AUX1, AUX2 are driven high ( $t_3$ ).
6. The clock on the CLK output is applied to the C3 contact ( $t_4$ ).
7. RST is enabled ( $t_5$ ).

**Time delays**

- $t_1 = t_0 + 384 \times 1/f_{OSC(INT)LOW}$
  - $t_2 = t_1$
  - $t_3 (t_{D(START)}) = t_1 + 17T/2$
  - $t_4 =$  driven by host microcontroller;  $> t_3$  and  $< t_5$
  - $t_5 (t_{D(END)}) = t_1 + 23T/2$ .
- $T = 64 \times 1/f_{OSC(INT)}$ .

**Figure 10. Activation sequence**

**6.8 Deactivation sequence**

When a session ends, the microcontroller sets  $\overline{CMDVCC}$  high. The ST8034 device then executes an automatic deactivation sequence by counting the sequencer back to the inactive state (see [Figure 11](#)):

1. RST goes low ( $t_{11}$ ).
2. The clock is stopped, CLK is low ( $t_{12}$ ).
3. I/O, AUX1, AUX2 are pulled low ( $t_{13}$ ).
4.  $V_{CC}$  falls to 0 V ( $t_{14}$ ). The deactivation sequence is completed when  $V_{CC}$  reaches its inactive state.
5.  $V_{CC} < 0.4$  V ( $t_{DEACT}$ ).
6. All card contacts become low impedance to GND. The I/OUC, AUX1UC and AUX2UC pins remain pulled up to  $V_{DD(INTF)}$  by the internal 10 k $\Omega$  pull-up resistor.
7. The internal oscillator returns to its low frequency mode.

**Time delays**

- $t_{11} = t_{10} + 3T / 64$
- $t_{12} = t_{11} + T / 2$
- $t_{13} = t_{11} + T$
- $t_{14} = t_{11} + 3T / 2$
- $t_{DEACT} = t_{11} + 3T / 2 + V_{CC}$  fall time.

$T = 64 \times 1/f_{OSC(INT)}$

**Figure 11. Deactivation sequence**

**6.9 V<sub>CC</sub> generator**

The LDO on the V<sub>CC</sub> output is capable of supplying up to 65 mA continuously at any selected V<sub>CC</sub> value (5 V, 3 V or 1.8 V). This output is overcurrent protected by the current limiter with a limit threshold value of 120 mA typ., with a glitch immunity allowing overcurrent pulses up to 200 mA with duration up to several microseconds not causing a deactivation (the average current value must stay below the specified current limit, see [Table 6 on page 11](#) and [Table 10 on page 17](#)).

A 100 nF capacitor (min.) with ESR < 350 mΩ should be tied to GND near the V<sub>CC</sub> pin and another low ESR 100 nF capacitor (min.) should be tied to GND also on the card side, near the card reader contact C1.
