

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Ultra-compact high-performance eCompass module: ultra-low-power 3D accelerometer and 3D magnetometer

Datasheet - production data

### Features

- 3 magnetic field channels and 3 acceleration channels
- $\pm 50$  gauss magnetic dynamic range
- $\pm 2/\pm 4/\pm 8/\pm 16$  g selectable acceleration full scales
- 16-bit data output
- SPI / I<sup>2</sup>C serial interfaces
- Analog supply voltage 1.71 V to 3.6 V
- Selectable power mode/resolution for accelerometer and magnetometer
- Single measurement mode for magnetometer
- Programmable interrupt generators for free-fall, motion detection and magnetic field detection
- Embedded self-test
- Embedded temperature sensor
- Embedded FIFO
- ECOPACK<sup>®</sup>, RoHS and "Green" compliant

### Applications

- Tilt-compensated compasses
- Map rotation
- Position detection
- Motion-activated functions
- Free-fall detection

- Click/double-click recognition
- Pedometers
- Intelligent power saving for handheld devices
- Display orientation
- Gaming and virtual reality input devices
- Impact recognition and logging
- Vibration monitoring and compensation

### Description

The LSM303AGR is an ultra-low-power high-performance system-in-package featuring a 3D digital linear acceleration sensor and a 3D digital magnetic sensor.

The LSM303AGR has linear acceleration full scales of  $\pm 2/\pm 4/\pm 8/\pm 16$  g and a magnetic field dynamic range of  $\pm 50$  gauss.

The LSM303AGR includes an I<sup>2</sup>C serial bus interface that supports standard, fast mode, fast mode plus, and high-speed (100 kHz, 400 kHz, 1 MHz, and 3.4 MHz) and an SPI serial standard interface.

The system can be configured to generate an interrupt signal for free-fall, motion detection and magnetic field detection.

The magnetic and accelerometer blocks can be enabled or put into power-down mode separately.

The LSM303AGR is available in a plastic land grid array package (LGA) and is guaranteed to operate over an extended temperature range from -40 °C to +85 °C.

**Table 1. Device summary**

| Part number | Temp. range [°C] | Package | Packaging     |
|-------------|------------------|---------|---------------|
| LSM303AGR   | -40 to +85       | LGA-12  | Tray          |
| LSM303AGRTR | -40 to +85       | LGA-12  | Tape and reel |

## 2 Module specifications

### 2.1 Sensor characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted<sup>(a)</sup>.

Table 3. Sensor characteristics

| Symbol   | Parameter   | Test conditions                            | Min. | Typ. <sup>(1)</sup> | Max. | Unit       |
|----------|---|--|------|---------------------|------|------------|
| LA_FS    | Linear acceleration measurement range                                 |  |      | ±2                  |      | g          |
|          |   |  |      | ±4                  |      |            |
|          |   |  |      | ±8                  |      |            |
|          |   |  |      | ±16                 |      |            |
| M_FS     | Magnetic dynamic range  |  |      | ±49.152             |      | gauss      |
| LA_So    | Linear acceleration sensitivity <sup>(2)</sup>                        | FS = ±2 g and in high-resolution mode      | -7%  | 0.98                | +7%  | mg/LSB     |
|          |   | FS = ±4 g and in high-resolution mode      | -7%  | 1.95                | +7%  |            |
|          |   | FS = ±8 g and in high-resolution mode      | -7%  | 3.9                 | +7%  |            |
|          |   | FS = ±16 g and in high-resolution mode     | -7%  | 11.72               | +7%  |            |
|          |   | FS = ±2 g and in normal mode               | -7%  | 3.9                 | +7%  |            |
|          |   | FS = ±4 g and in normal mode               | -7%  | 7.82                | +7%  |            |
|          |   | FS = ±8 g and in normal mode               | -7%  | 15.63               | +7%  |            |
|          |   | FS = ±16 g and in normal mode              | -7%  | 46.9                | +7%  |            |
|          |   | FS = ±2 g and in low-power mode            | -7%  | 15.63               | +7%  |            |
|          |   | FS = ±4 g and in low-power mode            | -7%  | 31.26               | +7%  |            |
|          |   | FS = ±8 g and in low-power mode            | -7%  | 62.52               | +7%  |            |
|          |   | FS = ±16 g and in low-power mode           | -7%  | 187.58              | +7%  |            |
| M_So     | Magnetic sensitivity <sup>(2)</sup>                                   |  | -7%  | 1.5                 | +7%  | mgauss/LSB |
| LA_TCSo  | Linear acceleration sensitivity change vs. temperature <sup>(3)</sup> |  |      | 0.01                |      | %/°C       |
| M_TCSo   | Magnetic sensitivity change vs. temperature <sup>(3)</sup>            |  |      | ±0.03               |      | %/°C       |
| LA_TyOff | Linear acceleration zero-g level offset accuracy <sup>(2)</sup>       |  | -80  | ±40                 | +80  | mg         |
| M_TyOff  | Magnetic sensor offset  | With offset cancellation <sup>(4)(5)</sup> | -60  |                     | +60  | mgauss     |
| LA_TCOff | Linear acceleration zero-g level change vs. temp. <sup>(3)</sup>      | Max. delta from 25 °C                      |      | ±0.5                |      | mg/°C      |
| M_TCOff  | Magnetic sensor offset change vs. temp. <sup>(4)</sup>                | With offset cancellation                   | -0.3 |                     | +0.3 | mgauss/°C  |

a. The product is factory calibrated at 2.5 V. The operational power supply range is from 1.71 V to 3.6 V.

**Table 3. Sensor characteristics (continued)**

| Symbol | Parameter   | Test conditions   | Min. | Typ. <sup>(1)</sup> | Max. | Unit         |
|--------|---|---|------|---------------------|------|--------------|
| LA_An  | Linear acceleration RMS noise   | ODR = 100 Hz, high-resolution mode, FS = $\pm 2\text{ g}$ |      | 3                   |      | mg (RMS)     |
| M_R    | Magnetic RMS noise <sup>(6)</sup>   | High-performance mode                                     |      | 3                   |      | mgauss (RMS) |
| LA_ST  | Linear acceleration self-test positive output change <sup>(7)(8)(9)</sup> | FS = $\pm 2\text{ g}$ ; normal mode                       | 17   |                     | 360  | LSB          |
| M_ST   | Magnetic self-test <sup>(10)</sup>  |   | 15   |                     | 500  | mgauss       |
| Top    | Operating temperature range   |   | -40  |                     | +85  | °C           |

1. Typical specifications are not guaranteed.
2. Values after factory calibration test and trimming.
3. Measurements are performed in a uniform temperature setup and they are based on characterization data in a limited number of samples, not measured during final test for production.
4. Based on characterization data on a limited number of samples, not measured during final test for production.
5. Excluding drift due to magnetic shock.
6. With low-pass filter or offset cancellation enabled.
7. The sign of "Self-test output change" is defined by the ST bit in [CTRL\\_REG4\\_A \(23h\)](#), for all axes.
8. "Self-test output change" is defined as the absolute value of:  

$$\text{OUTPUT[LSb]}_{(\text{Self-test enabled})} - \text{OUTPUT[LSb]}_{(\text{Self-test disabled})}$$
 1LSb = 3.9 mg in normal mode (10-bit) at FS= $\pm 2\text{ g}$ .
9. After enabling the ST bit, correct data is obtained after two samples (low-power mode / normal mode) or after eight samples (high-resolution mode).
10. Magnetic "self-test" is defined as:  $\text{OUTPUT[gauss]}_{(\text{Self-test enabled})} - \text{OUTPUT[gauss]}_{(\text{Self-test disabled})}$ .

## 2.2 Temperature sensor characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted.<sup>(b)</sup>.

**Table 4. Temperature sensor characteristics**

| Symbol | Parameter                                  | Test conditions | Min. | Typ. <sup>(1)</sup> | Max. | Unit                    |
|--------|--|-----------------|------|---------------------|------|-------------------------|
| TSDr   | Temperature sensor output change vs. temp. |                 |      | 1                   |      | digit/°C <sup>(2)</sup> |
| TODR   | Temperature refresh rate                   |                 |      | ODR <sup>(3)</sup>  |      | Hz                      |
| Top    | Operating temperature range                |                 | -40  |                     | +85  | °C                      |

1. Typical specifications are not guaranteed.

2. 8-bit resolution.

3. Refer to [Table 35](#).

## 2.3 Electrical characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted.<sup>(b)</sup>

**Table 5. Electrical characteristics**

| Symbol    | Parameter   | Test conditions             | Min.         | Typ. <sup>(1)</sup> | Max.    | Unit |
|-----------|---|-----------------------------|--------------|---------------------|---------|------|
| Vdd       | Supply voltage  |                             | 1.71         |                     | 3.6     | V    |
| Vdd_IO    | Module power supply for I/O <sup>(2)</sup>  |                             | 1.71         | 1.8                 | Vdd+0.1 | V    |

1. Typical specifications are not guaranteed.

2. It is possible to remove Vdd maintaining Vdd\_IO without blocking the communication bus, in this condition the measurement chain is powered off.

b. The product is factory calibrated at 2.5 V. The operational power supply range is from 1.71 V to 3.6 V.

## 2.4 Communication interface characteristics

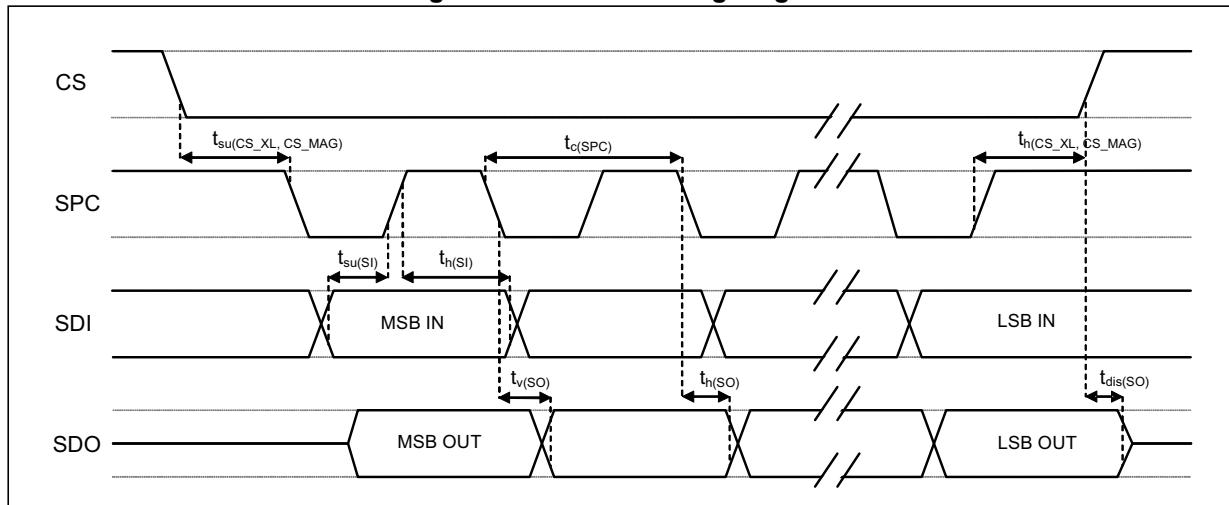

### 2.4.1 SPI - serial peripheral interface

Subject to general operating conditions for Vdd and Top.

**Table 6. SPI slave timing values**

| Symbol                                  | Parameter               | Value <sup>(1)</sup> |     | Unit |
|---|-------------------------|----------------------|-----|------|
|   |                         | Min                  | Max |      |
| $t_c(\text{SPC})$                       | SPI clock cycle         | 100                  |     | ns   |
| $f_c(\text{SPC})$                       | SPI clock frequency     |                      | 10  | MHz  |
| $t_{su}(\text{CS\_XL}, \text{CS\_MAG})$ | CS setup time           | 5                    |     | ns   |
| $t_h(\text{CS\_XL}, \text{CS\_MAG})$    | CS hold time            | 20                   |     |      |
| $t_{su}(\text{SI})$                     | SDI input setup time    | 5                    |     |      |
| $t_h(\text{SI})$                        | SDI input hold time     | 15                   |     |      |
| $t_v(\text{SO})$                        | SDO valid output time   |                      | 50  |      |
| $t_h(\text{SO})$                        | SDO output hold time    | 5                    |     |      |
| $t_{dis}(\text{SO})$                    | SDO output disable time |                      | 50  |      |

**Figure 3. SPI slave timing diagram**

Note: Values are guaranteed at 10 MHz clock frequency for SPI with 3 wires, based on characterization results, not tested in production.

Measurement points are done at  $0.2 \cdot Vdd\_IO$  and  $0.8 \cdot Vdd\_IO$ , for both input and output ports.

## 2.4.2 I<sup>2</sup>C - inter-IC control interface

Subject to general operating conditions for Vdd and Top.

**Table 7. I<sup>2</sup>C slave timing values (standard and fast mode)**

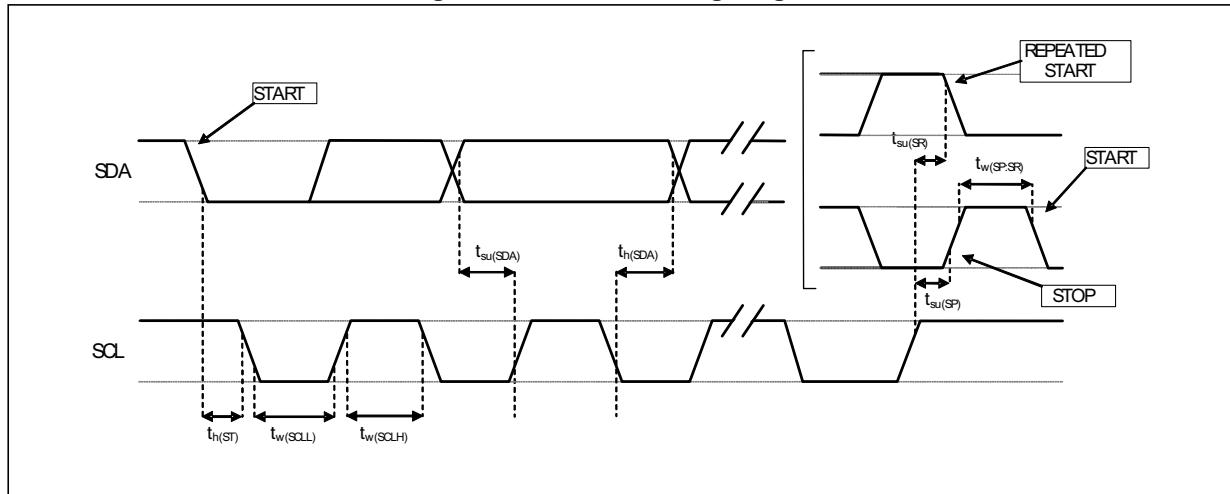

| Symbol                | Parameter                                      | I <sup>2</sup> C standard mode <sup>(1)</sup> |      | I <sup>2</sup> C fast mode <sup>(1)</sup> |     | Unit |
|-----------------------|--|---|------|---|-----|------|
|                       |  | Min   | Max  | Min                                       | Max |      |
| f <sub>(SCL)</sub>    | SCL clock frequency                            | 0   | 100  | 0   | 400 | kHz  |
| t <sub>w(SCLL)</sub>  | Low period of the SCL clock                    | 4.7   |      | 1.3                                       |     | μs   |
| t <sub>w(SCLH)</sub>  | High period of the SCL clock                   | 4.0   |      | 0.6                                       |     |      |
| t <sub>su(SDA)</sub>  | Data setup time                                | 250   |      | 100                                       |     | ns   |
| t <sub>h(SDA)</sub>   | Data hold time                                 | 0   | 3.45 | 0   | 0.9 | μs   |
| t <sub>h(ST)</sub>    | START condition hold time                      | 4   |      | 0.6                                       |     |      |
| t <sub>su(SR)</sub>   | Setup time for a repeated START condition      | 4.7   |      | 0.6                                       |     |      |
| t <sub>su(SP)</sub>   | Setup time for STOP condition                  | 4   |      | 0.6                                       |     |      |
| t <sub>w(SP:SR)</sub> | Bus free time between STOP and START condition | 4.7   |      | 1.3                                       |     |      |

1. Data based on standard I<sup>2</sup>C protocol requirement, not tested in production.

**Table 8. I<sup>2</sup>C slave timing values (fast mode plus and high speed)**

| Symbol                | Parameter                                      | I <sup>2</sup> C fast mode plus <sup>(1)</sup> |     | I <sup>2</sup> C high speed <sup>(1)</sup> |      | Unit |
|-----------------------|--|--|-----|--|------|------|
|                       |  | Min  | Max | Min  | Max  |      |
| f <sub>(SCL)</sub>    | SCL clock frequency                            | 0  | 1   | 0  | 3.4  | MHz  |
| t <sub>w(SCLL)</sub>  | Low period of the SCL clock                    | 0.5  |     | 0.16                                       |      | μs   |
| t <sub>w(SCLH)</sub>  | High period of the SCL clock                   | 0.26   |     | 0.06                                       |      |      |
| t <sub>su(SDA)</sub>  | Data setup time                                | 50   |     | 10   |      | ns   |
| t <sub>h(SDA)</sub>   | Data hold time                                 | 0  |     | 0  | 0.07 | μs   |
| t <sub>h(ST)</sub>    | START condition hold time                      | 0.26   |     | 0.16                                       |      |      |
| t <sub>su(SR)</sub>   | Setup time for a repeated START condition      | 0.26   |     | 0.16                                       |      |      |
| t <sub>su(SP)</sub>   | Setup time for STOP condition                  | 0.26   |     | 0.16                                       |      |      |
| t <sub>w(SP:SR)</sub> | Bus free time between STOP and START condition | 0.5  |     |  |      |      |

1. Data based on standard I<sup>2</sup>C protocol requirement, not tested in production.

**Figure 4. I<sup>2</sup>C slave timing diagram**

Note: Measurement points are done at  $0.2 \cdot Vdd\_IO$  and  $0.8 \cdot Vdd\_IO$ , for both ports.

## 2.5 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 9. Absolute maximum ratings**

| Symbol           | Ratings   | Maximum value       | Unit  |
|------------------|---|---------------------|-------|
| Vdd              | Supply voltage  | -0.3 to 4.8         | V     |
| Vdd_IO           | I/O pins supply voltage   | -0.3 to 4.8         | V     |
| Vin              | Input voltage on any control pin<br>(CS_XL, CS_MAG, SCL/SPC, SDA/SDI/SDO) | -0.3 to Vdd_IO +0.3 | V     |
| A <sub>POW</sub> | Acceleration (any axis, powered, Vdd = 2.5 V)                             | 3000 for 0.5 ms     | g     |
|                  |   | 10000 for 0.2 ms    | g     |
| A <sub>UNP</sub> | Acceleration (any axis, unpowered)  | 3000 for 0.5 ms     | g     |
|                  |   | 10000 for 0.2 ms    | g     |
| M <sub>EF</sub>  | Maximum exposed field   | 10000               | gauss |
| T <sub>OP</sub>  | Operating temperature range   | -40 to +85          | °C    |
| T <sub>STG</sub> | Storage temperature range   | -40 to +125         | °C    |
| ESD              | Electrostatic discharge protection (HBM)                                  | 2                   | kV    |

*Note:* Supply voltage on any pin should never exceed 4.8 V

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

## 3 Terminology

### 3.1 Sensitivity

#### 3.1.1 Linear acceleration sensor sensitivity

Sensitivity describes the gain of the sensor and can be determined by applying 1 g acceleration to it. As the sensor can measure DC accelerations this can be done easily by pointing the axis of interest towards the center of the Earth, noting the output value, rotating the sensor by 180 degrees (pointing to the sky) and noting the output value again. By doing so,  $\pm 1 \text{ g}$  acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and time. The sensitivity tolerance describes the range of sensitivities of a large population of sensors.

#### 3.1.2 Magnetic sensor sensitivity

Sensitivity describes the ratio of the output digital data expressed in LSB units and the applied magnetic field expressed in mG (milligauss). It can be measured, for example, by applying a known magnetic field along one axis and measuring the digital output of the device.

### 3.2 Zero-g level

The zero-g level offset (LA\_TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface will measure 0 g on the X-axis and 0 g on the Y-axis whereas the Z-axis will measure 1 g. The output is ideally in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called zero-g offset. Offset is to some extent a result of stress to MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little with temperature, see [Table 3](#) "Zero-g level change vs. temperature" (LA\_TCOFF). The zero-g level tolerance (TyOff) describes the standard deviation of the range of zero-g levels of a population of sensors.

### 3.3 Zero-gauss level

Zero-gauss level offset (M\_TyOff) describes the deviation of an actual output signal from the ideal output if no magnetic field is present.

### 3.4 Magnetic dynamic range

The magnetic dynamic range is defined as the magnetic field driven along one sensitive axis, giving the maximum digital output value.

## 4      Functionality

### 4.1    Magnetometer

#### 4.1.1    Magnetometer power modes

The LSM303AGR magnetometer provides two different power modes: high-resolution and low-power modes.

The tables below summarize the magnetometer RMS noise values and current consumption in different product configurations.

When the low-pass filter is enabled, the bandwidth is reduced while noise performance is improved without any increase in power consumption.

**Table 10. RMS noise of operating modes**

| CFG_REG_B_M[LPF]<br>or<br>CFG_REG_B_M[OFF_CANC] | (CFG_REG_A_M [LP = 0])<br>high-resolution mode |                | (CFG_REG_A_M [LP = 1])<br>low-power mode |                |
|---|--|----------------|--|----------------|
|   | BW [Hz]  | Noise RMS [mg] | BW [Hz]                                  | Noise RMS [mg] |
| 0 (disable)                                     | ODR/2  | 4.5            | ODR/2                                    | 9              |
| 1 (enable)                                      | ODR/4  | 3              | ODR/4                                    | 6              |

**Table 11. Current consumption of operating modes**

| ODR<br>(Hz) | Current consumption<br>( $\mu$ A)<br>(CFG_REG_A_M<br>[LP] = 0)<br>high-resolution<br>CFG_REG_B_M<br>[OFF_CANC] = 0 | Current consumption<br>( $\mu$ A)<br>(CFG_REG_A_M<br>[LP] = 1)<br>low-power<br>CFG_REG_B_M<br>[OFF_CANC] = 0 | Current consumption<br>( $\mu$ A)<br>(CFG_REG_A_M<br>[LP] = 0)<br>high-resolution<br>CFG_REG_B_M<br>[OFF_CANC] = 1 | Current consumption<br>( $\mu$ A)<br>(CFG_REG_A_M<br>[LP] = 1)<br>low-power<br>CFG_REG_B_M<br>[OFF_CANC] = 1 |
|-------------|--|--|--|--|
| 10          | 100  | 25   | 120  | 50   |
| 20          | 200  | 50   | 235  | 100  |
| 50          | 475  | 125  | 575  | 235  |
| 100         | 950  | 250  | 1130   | 460  |

The following table summarizes the turn-on time of the magnetometer in the two different power modes with the offset cancellation function enabled or disabled (see [Section 4.1.2: Magnetometer offset cancellation](#)).

**Table 12. Operating mode and turn-on time**

| Operating mode      | Turn-on time              |                           |
|---------------------|---------------------------|---------------------------|
| CFG_REG_A_M[LP]     | CFG_REG_A_M[OFF_CANC = 0] | CFG_REG_A_M[OFF_CANC = 1] |
| 0 (high-resolution) | 9.4 ms                    | 9.4 ms + 1/ODR            |
| 1 (low-power)       | 6.4 ms                    | 6.4 ms + 1/ODR            |

The LSM303AGR offers single measurement mode in both high-resolution and low-power modes.

Single measurement mode is enabled by writing bits MD[1:0] to '01' in [CFG\\_REG\\_A\\_M \(60h\)](#).

In single measurement mode, once the measurement has been performed, the DRDY pin is set to high, data is available in the output register and the LSM303AGR is automatically configured in idle mode by setting the MD[1] bit to '1'.

Single measurement is independent of the programmed ODR but depends on the frequency at which the MD[1:0] bits are written by the microcontroller/application processor.

Maximum ODR frequency achievable in single mode measurement is given in the following table.

**Table 13. Maximum ODR in single measurement mode (HR and LP modes)**

| Maximum ODR | Power mode (CFG_REG_A_M[LP]) |
|-------------|------------------------------|
| 100 Hz      | High resolution (LP = '0')   |
| 150 Hz      | Low power (LP = '1')         |

In single measurement mode, for ODR < 10 Hz, current consumption can be calculated with the following formula:

$$(\text{Current_consumption\_10Hz} - \text{Current_consumption\_in\_power\_down}) / (10 \text{ Hz} / \text{ODR}) + \text{Current_consumption\_in\_power\_down}$$

Where Current\_consumption\_in\_power\_down and Current\_consumption\_10Hz can be found, respectively, in [Table 5](#) and [Table 11](#).

#### 4.1.2 Magnetometer offset cancellation

Offset cancellation is the result of performing a set and reset in the magnetic sensor.

The offset cancellation technique is defined as follows:

$$H_{out} = \frac{H_n + H_{n-1}}{2}$$

where  $H_n$  and  $H_{n-1}$  are two consecutive magnetic field measurements, one after a set pulse, the other after a reset pulse.

Considering a magnetic offset ( $H_{off}$ ), the two magnetic field measurements are:

- Set:  $H_n = H + H_{off}$
- Reset:  $H_{n-1} = H - H_{off}$

The offset is cancelled according to the offset cancellation technique:

$$H_{out} = \frac{H_n + H_{n-1}}{2} = \frac{2H + H_{off} - H_{off}}{2} = H$$

In the LSM303AGR offset cancellation is enabled by setting bit OFF\_CANC = 1 (and bit OFF\_CANC\_ONE\_SHOT = 1 in single measurement mode) in [CFG\\_REG\\_B\\_M \(61h\)](#).

Offset cancellation is automatically managed by the device in continuous mode.

Offset cancellation has to be managed by the user in single measurement mode averaging two consecutive measurements  $H_n$  and  $H_{n-1}$ .

If offset cancellation is disabled, a set of the magnetic sensor is performed anyway.

The set pulse frequency can be configured by setting the Set\_FREQ bit in [CFG\\_REG\\_B\\_M \(61h\)](#).

#### 4.1.3 Magnetometer interrupt

In the LSM303AGR the magnetometer interrupt signal generation is based on the comparison between data and a programmable threshold.

To enable the interrupt function, in INT\_CTRL\_REG\_M register (63h) the "IEN" bit must be set to '1'.

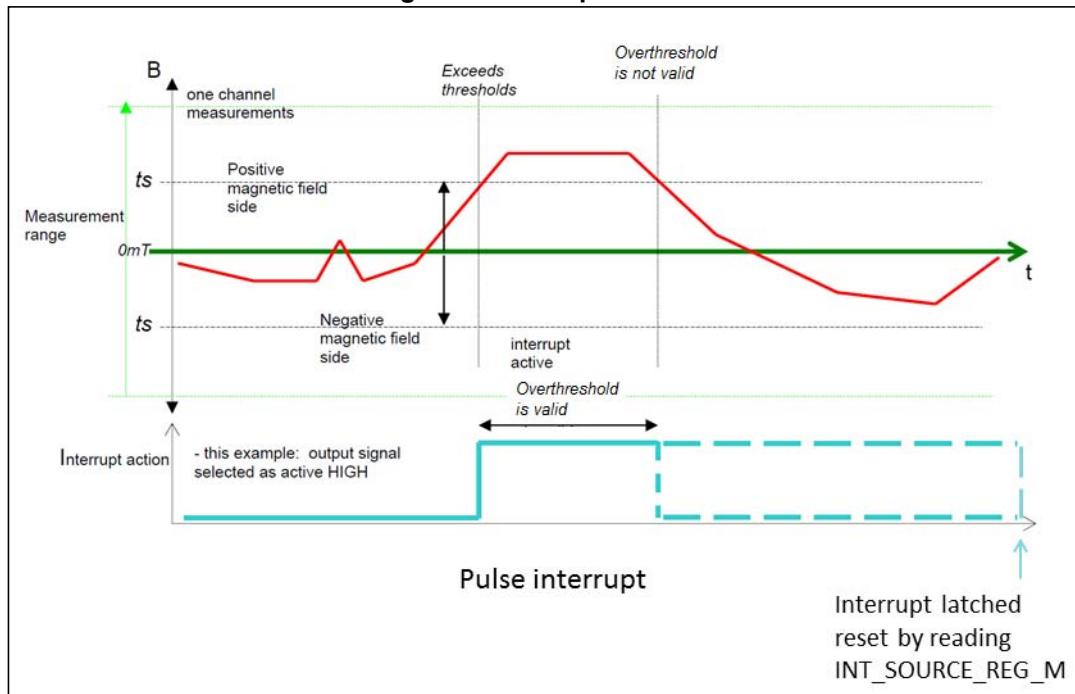

In the LSM303AGR the user can select the axis/axes in which the interrupt function can be enabled. In order to do this, the XIEN, YIEN, and ZIEN bits in [INT\\_CTRL\\_REG\\_M \(63h\)](#) need be set properly.

The threshold value can be programmed by setting the [INT\\_THS\\_L\\_REG\\_M \(65h\)](#) and [INT\\_THS\\_H\\_REG\\_M \(66h\)](#) registers.

The threshold is expressed in absolute value as a 15-bit unsigned number. The threshold has the same sensitivity as the magnetic data.

When magnetic data exceeds the positive or the negative threshold, the interrupt signal is generated and the information about the type of interrupt is stored in the [INT\\_SOURCE\\_REG\\_M \(64h\)](#) register. In particular, when magnetic data exceeds the positive threshold the P\_TH\_S\_axis bit is set to '1', while if data exceeds the negative threshold the N\_TH\_S\_axis bit is set to '1'. If magnetic data lay between the positive and the negative thresholds, no interrupt signal is released.

Figure 5. Interrupt function

Two different approaches for the interrupt function are available:

- Typical: comparison is between magnetic data read by the sensor and the programmable threshold;
- Advanced: comparison is made between magnetic data after hard-iron correction and the programmable threshold.

These approaches are configurable by setting the INT\_on\_DataOFF bit in [CFG\\_REG\\_B\\_M \(61h\)](#).

If INT\_on\_DataOFF is set to '0' the typical approach is selected, otherwise if it is set to '1' the advanced approach is selected.

Two different interrupts are available:

- Pulsed interrupt signal: it goes high when the magnetic data exceed one of the two thresholds and goes low when the magnetic data are between the two thresholds. This kind of interrupt is selected by setting the IEL bit in [INT\\_CTRL\\_REG\\_M \(63h\)](#) to '0'.
- Latched interrupt signal: it goes high when the data exceed one of the two thresholds but is reset only once the source register is read and not when the magnetic data returns between the two thresholds. This kind of interrupt is selected by setting the IEL bit in [INT\\_CTRL\\_REG\\_M \(63h\)](#) to '1'.

The interrupt signal polarity can be set using the IEA bit in [INT\\_CTRL\\_REG\\_M \(63h\)](#).

If IEA is set to '1' then the interrupt signal is active high, while if it is set to '0' the interrupt signal is active low.

In order to drive the interrupt signal from the DRDY pad, the INT\_MAG\_PIN bit in [CFG\\_REG\\_C\\_M \(62h\)](#) must be set to '1'.

#### 4.1.4 Magnetometer hard-iron compensation

Hard-iron distortion occurs when a magnetic object is placed near the magnetometer and appears as a permanent bias in the sensor's outputs.

The hard-iron correction consists of compensating magnetic data from hard-iron distortion.

The operation is defined as follows:

$$H_{\text{out}} = H_{\text{read}} - H_{\text{HI}}$$

where:

- $H_{\text{read}}$  is the generic uncompensated magnetic field data, as read by the sensor;
- $H_{\text{HI}}$  is the hard-iron distortion field;
- $H_{\text{out}}$  is the compensated magnetic data.

The computation of the hard-iron distortion field should be performed by an external processor. After the computation of the hard iron-distortion field has been performed, the measured magnetic data can be compensated.

The LSM303AGR offers the possibility of storing hard-iron data inside six dedicated registers from 45h to 4Ah.

Each register contains eight bits so that the hard-iron data can be expressed as a 16-bit two's complement number. The OFFSET\_axis\_REG\_H registers contain the MSBs of the hard-iron data, while the OFFSET\_axis\_REG\_L registers contain the LSBs.

Hard-iron data have the same format and weight of the magnetic output data. The hard-iron values stored in dedicated registers are automatically subtracted from the output data.

#### 4.1.5 Magnetometer self-test

The self-test function is available for the magnetic sensor. When the magnetic self-test is enabled, a current is forced into a coil inside the device. This current will generate a magnetic field that will produce a variation of the magnetometer output signals. If the output signals change within the amplitude limits specified in [Table 3](#), then the sensor is working properly and the parameters of the interface chip are within the defined specifications.

The self-test procedure is described in the following figure.
