

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

SLLIMM™ nano - 2nd series IPM, 3-phase inverter, 5 A,
1.0 Ω max., 600 V N-channel MDmesh™ DM2

Datasheet - production data

Applications

- 3-phase inverters for motor drives
- Dish washers, refrigerator compressors, heating systems, air-conditioning fans, draining and recirculation pumps

Description

This SLLIMM (small low-loss intelligent molded module) nano provides a compact, high performance AC motor drive in a simple, rugged design. It is composed of six N-channel MDmesh DM2 MOSFETs with intrinsic fast recovery diode and three half-bridge HVICs for gate driving, providing low electromagnetic interference (EMI) characteristics with optimized switching speed. The package is designed to allow a better and easy screw on heatsink. It is optimized for thermal performance and compactness in built-in motor applications, or other low power applications where assembly space is limited. This IPM includes an operational amplifier, completely uncommitted, and a comparator that can be used to design a fast and efficient protection circuit. SLLIMM™ is a trademark of STMicroelectronics.

Features

- IPM 5 A, 600 V, $R_{DS(on)} = 1.0 \Omega$, 3-phase MOSFET inverter bridge including control ICs for gate driving
- Optimized for low electromagnetic interference
- 3.3 V, 5 V, 15 V CMOS/TTL input comparators with hysteresis and pull-down/pull-up resistors
- Undervoltage lockout
- Internal bootstrap diode
- Interlocking function
- Smart shutdown function
- Comparator for fault protection against overtemperature and overcurrent
- Op-amp for advanced current sensing
- Optimized pinout for easy board layout
- NTC for temperature control (UL 1434 CA 2 and 4)
- Isolation ratings of 1500 Vrms/min.
- UL recognition: UL 1557 file E81734

4 Smart shutdown function

The device integrates a comparator for fault sensing purposes. The comparator has an internal voltage reference V_{REF} connected to the inverting input, while the non-inverting input on pin (CIN) can be connected to an external shunt resistor for overcurrent protection.

When the comparator triggers, the device is set to the shutdown state and both of its outputs are set to low level, causing the half-bridge to enter a tri-state.

In common overcurrent protection architectures, the comparator output is usually connected to the shutdown input through an RC network so to provide a mono-stable circuit which implements a protection time following to fault condition.

Our smart shutdown architecture immediately turns off the output gate driver in case of overcurrent through a preferential path for the fault signal which directly switches off the outputs. The time delay between the fault and output shutdown no longer depends on the RC values of the external network connected to the shutdown pin. At the same time, the DMOS connected to the open-drain output (pin T/ \overline{SD} /OD) is turned on by the internal logic, which holds it on until the shutdown voltage is well below the minimum value of logic input threshold (V_{il}).

Besides, the smart shutdown function allows the real disable time to be increased without rising the constant time of the external RC network.

NTC thermistor for temperature monitoring is internally connected in parallel to the \overline{SD} pin. To avoid undesired shutdown, keep the voltage $V_{T/\overline{SD}/OD}$ higher than the high level logic threshold by setting the pull-up resistor $R_{\overline{SD}}$ to 1 k Ω or 2.2 k Ω for 3.3 V or 5 V MCU power supplies, respectively.

Please refer to [Table 13: "Sense comparator characteristics \(VCC = 15 V unless otherwise specified\)"](#) for internal propagation delay time details.

5 Application circuit example

Figure 10: Application circuit example

Application designers are free to use a different scheme according to the specifications of the device.

5.1 Guidelines

- Input signals HIN, LIN are active high logic. A 375 k Ω (typ.) pull-down resistor is built-in for each input. To prevent input signal oscillations, the wiring of each input should be as short as possible and the use of RC filters (R_1 , C_1) on each input signal is suggested. The filters should be with a time constant of about 100 ns and placed as close as possible to the IPM input pins.
- The use of a bypass capacitor CVCC (aluminum or tantalum) helps to reduce the transient circuit demand on the power supply. Furthermore, to reduce high frequency switching noise distributed on the power lines, a decoupling capacitor C_2 (100 to 220 nF, with low ESR and low ESL) should be placed as close as possible to Vcc pin and in parallel with the bypass capacitor.
- The use of RC filter (RSF, CSF) is recommended to prevent protection circuit malfunction. The time constant ($RSF \times CSF$) should be set to 1 μ s and the filter must be placed as close as possible to the CIN pin.
- The \overline{SD} is an input/output pin (open-drain type if used as output). A built-in thermistor NTC is internally connected between the \overline{SD} pin and GND. The voltage VSD-GND decreases as the temperature increases, due to the pull-up resistor RSD. In order to keep the voltage always higher than the high level logic threshold, the pull-up resistor has to be set to 1 k Ω or 2.2 k Ω for 3.3 V or 5 V MCU power supply, respectively. The CSD capacitor of the filter on \overline{SD} should be fixed no higher than 3.3 nF in order to assure \overline{SD} activation time $\tau_1 \leq 500$ ns and the filter should be placed as close as possible to the \overline{SD} pin.
- The decoupling capacitor C_3 (from 100 to 220 nF, ceramic with low ESR and low ESL), in parallel with each C_{boot} , filters high frequency disturbance. Both C_{boot} and C_3 (if present) should be placed as close as possible to the U, V, W and V_{boot} pins. Bootstrap negative electrodes should be connected to U, V, W terminals directly and separated from the main output wires.
- To prevent the overvoltage on Vcc pin, a Zener diode (Dz1) can be used. Similarly on the V_{boot} pin, a Zener diode (Dz2) can be placed in parallel with each C_{boot} .
- The use of the decoupling capacitor C_4 (100 to 220 nF, with low ESR and low ESL) in parallel with the electrolytic capacitor C_{vdc} prevents surge destruction. Both capacitors C_4 and C_{vdc} should be placed as close as possible to the IPM (C_4 has priority over C_{vdc}).
- By integrating an application-specific type HVIC inside the module, direct coupling to the MCU terminals without an optocoupler is possible.
- Low inductance shunt resistors for phase leg current sensing have to be used.
- In order to avoid malfunctions, the wiring on N pins, the shunt resistor and PWR_GND should be as short as possible.
- The connection of SGN_GND to PWR_GND to the point only (close to the shunt resistor terminal) reduces the impact of power ground fluctuation.

These guidelines ensure the specifications of the device for application designs. For further details, please refer to the relevant application note.
