

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Low voltage 2-channel constant current LED driver with charge pump

Datasheet - production data

Features

- Operating voltage range: V_{CC} 2.7 V to 5.5 V
- 2-channel LED driver with individual ON/OFF control directly from input pins
- Individually programmable output current for the 2 channels through 2 external resistors with a max. capability of 30 mA
- Absolute output current accuracy of max. $\pm 7\%$ and channel-to-channel mismatch of max. $\pm 4\%$
- Selectable charge pump enable/disable
- Thermal protection
- Small QFN20 (1.8x3.2 mm) package

Applications

- Mobile phone display backlighting

Description

The STP2CMP is a charge-pump-based 2-channel LED driver designed for RGB illumination or LCD display backlighting. The STP2CMP works off a battery with an input voltage between 2.7 V and 5.5 V. The device generates regulated current sinks with high absolute and channel-to-channel accuracy to drive up to 2 LEDs. It can support LEDs with forward voltage as high as 3.8 V. The current sink for each channel can be set with 2 individual external resistors. Each channel is controlled independently. The PWM control can be applied directly to the 2 EN (enable) pins to provide brightness control. When enabled, the charge pump, which uses a small ceramic bucket capacitor between C_{1P} and C_{1N} , operates to regulate the V_{OUT} with a clamping voltage at typ. 5 V. The tiny QFN20 (1.8x3.2 mm) package allows the device to be also used for applications with space limitations.

T_{SD}	Thermal shutdown			150		$^\circ\text{C}$
T_{HS}	Thermal shutdown hysteresis			15		$^\circ\text{C}$

5 Detailed description

The STP2CMP is a charge-pump-based 2-channel LED driver designed for mobile phone display backlighting, using constant current topology. Each of the 2 channels can be controlled independently. When ONx is pulled high, a constant current is sunk into the LEDx pin when one LED is connected. This constant current is defined or programmed by the value of the resistor on the I_{SETX} pin.

5.1 Enable pin (EN)

The active high enable input pin is used to shut down the whole device. When this pin is pulled low, the device enters into shutdown mode with only 5 μA max. current consumption. An internal pull-down of 300 kΩ is present on this pin.

5.2 LED turn-on pin (ONx)

When the EN pin is pulled high, the STP2CMP provides the flexibility to control the turning on/off on the 2 channels independently through the 2 active high ON pins. To control the brightness of each LED channel, it is possible to drive the selected ON pin with a PWM signal with a frequency up to a minimum T_{ON}/T_{OFF} of 33 μs. An internal pull-down of 300 kΩ is present on these pins.

5.3 Programmable output current

The LED currents at the 2 channels are programmed individually through a resistor connected from I_{SET1}, I_{SET2} to ground. The relationship between the resistor (R_{SET}) and the LED current (I_{LED}) is governed by the below equation:

$$R_{SET} = 16 \times (1.22/I_{LED})$$

5.4 Charge pump

The STP2CMP charge pump can be disabled or enabled according to the CP_SEL pin. When enabled (CP_SEL is high), the charge pump provides a clamping voltage of typ. 5.0 V to ensure enough headroom to drive the LEDs. An internal pull-down of 300 kΩ is present on this pin. The charge pump can be disabled by pulling low the CP_SEL pin, based on the V_{CC} and forward voltage of the LEDs used. This allows the connection of V_{CC} directly to V_{OUT} to drive the external LEDs. At V_{CC} ≥ 3.1 V the charge pump maintains regulation at 5 V when the total current drawn from it (at V_{OUT} pin) is ≤ 120 mA. At 2.7 ≤ V_{CC} < 3.1 V so that the charge pump maintains the regulation at 5 V, the total current drawn from it (on V_{OUT} pin) must be lowered to ≤ 40 mA.

5.5 Thermal protection

The thermal protection circuit ensures device shutdown when it is overheated (for example, due to an output short-circuit) to typ. 150 °C. The device resumes normal operation when the temperature drops by 15 °C from the thermal shutdown threshold.

7 PCB layout

7.1 Recommended

The STP2CMP is a charge pump power device so it requires a proper PCB layout in order to obtain the necessary stability and optimize line/load regulation and output voltage ripple. Input, output, and boost capacitors must be as close as possible to their relative pins. The example of the evaluation board below is shared with the STP4CMP device which is a pin compatible device with 4 current sources and the same architecture.
