Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

SX1501/SX1502/SX1503

4/8/16 Channel Low Voltage GPIO with NINT and NRESET

GENERAL DESCRIPTION

The SX1501, SX1502 and SX1503 are complete ultra low voltage General Purpose parallel Input/Output (GPIO) expanders ideal for low power handheld battery powered equipment. They allow easy serial expansion of I/O through a standard I^2C interface. GPIO devices can provide additional control and monitoring when the microcontroller or chipset has insufficient I/O ports, or in systems where serial communication and control from a remote location is advantageous.

These devices can also act as a level shifter to connect a microcontroller running at one voltage level to a component running at a different voltage level. The core is operating as low as 1.2V while the I/O banks can operate between 1.2V and 5.5V independent of the core voltage and each other.

Each GPIO is programmable via 8-bit configuration registers. Data registers, direction registers, pull-up/pull-down registers, interrupt mask registers and interrupt registers allow the system master to program and configure 4 or 8 or 16-GPIOs using a standard 400kHz I^2C interface.

The SX1501, SX1502 and SX1503 offer a unique fully programmable logic functions like a PLD to give more flexibility and reduce external logic gates used for standard applications.

The SX1501, SX1502 and SX1503 have the ability to generate mask-programmable interrupts based on falling/rising edge of any of its GPIO lines. A dedicated pin indicates to a host controller that a state change occurred in one or more of the GPIO lines.

The SX1501, SX1502 and SX1503 each come in a small QFN-UT-20/28 package. All devices are rated from -40°C to +85°C temperature range.

ORDERING INFORMATION

Part Number	I/O Channels	Package
SX1501I087TRT	4	QFN-UT-20
SX1502I087TRT	8	QFN-UT-20
SX1503I091TRT	16	QFN-UT-28

[(1)] SX1502I087TRT based, unique evaluation kit for the three parts.

KEY PRODUCT FEATURES

- 4/8/16 channel of I/Os
  - True bi-directional style I/O
  - Programmable Pull-up/Pull-down
  - Push/Pull outputs
- 1.2V to 5.5V independent operating voltage for all supply rails (VDDM, VCC1, VCC2)
- 5.5V compatible I/Os, up to 24mA output sink (no total sink current limit)
- Fully programmable logic functions (PLD)
- 400kHz 2-wire I^2C compatible slave interface
- Open drain active low interrupt output (NINT)
  - Bit maskable
  - Programmable edge sensitivity
- Power-On Reset and reset input (NRESET)
- Ultra low current consumption of typ. 1uA
- -40°C to +85°C operating temperature range
- Ultra-Thin 3x3mm QFN-UT-20 package (SX1501/SX1502)
- Ultra-Thin 4x4mm QFN-UT-28 package (SX1503)

TYPICAL APPLICATIONS

- Cell phones, PDAs, MP3 players
- Digital camera
- Portable multimedia player
- Notebooks
- GPS Units
- Industrial, ATE
- Any battery powered equipment

2 ELECTRICAL CHARACTERISTICS

2.1 Absolute Maximum Ratings

Stress above the limits listed in the following table may cause permanent failure. Exposure to absolute ratings for extended time periods may affect device reliability. The limiting values are in accordance with the Absolute Maximum Rating System (IEC 134). All voltages are referenced to ground (GND).

Symbol	Description	Min	Max	Unit
$VDDM_{max}$	Main supply voltage	- 0.4	6.0	V
$VCC1,2_{max}$	I/O banks supply voltage	- 0.4	6.0	V
V_{ESD_HBM}	Electrostatic handling HBM model(1)	-	1500	V
V_{ESD_CDM}	Electrostatic handling CDM model	-	300	V
V_{ESD_MM}	Electrostatic handling MM model	-	200	V
T_A	Operating Ambient Temperature Range	-40	+85	°C
T_C	Junction Temperature Range	-40	+125	°C
T_{STG}	Storage Temperature Range	-55	+150	°C
I_{lat}	Latchup-free input pin current(2)	+/-100	-	mA

(1) Assuming no load connected to outputs and inputs fixed to VCC1,2 or GND.
(2) Can be increased in RegAdvanced register. Please refer to §2.2.1 for more details.
(3) All values referred to $VIH_{MR\ min}$ and $VIL_{M\ max}$ levels.
(4) A device must internally provide a hold time of at least 300ns for the SDA signal (referred to $VIH_{MR\ min}$) to bridge the undefined region of the falling edge of SCL.
(5) The maximum $t_{HD;DAT}$ has only to be met if the device does not stretch the LOW period (t_{LOW}) of the SCL signal.
(6) A Fast-mode I^2C-bus device can be used in a Standard-mode I^2C-bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal.
If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{r\ max} + t_{SU;DAT} = 1000 + 250 = 1250$ ns (according to the Standard-mode I2C-bus specification) before the SCL line is released.
(7) C_b = total capacitance of one bus line in pF. If mixed with Hs-mode devices, faster fall-times are allowed.

4 BLOCK DETAILED DESCRIPTION

4.1 SX1501 4-channel GPIO

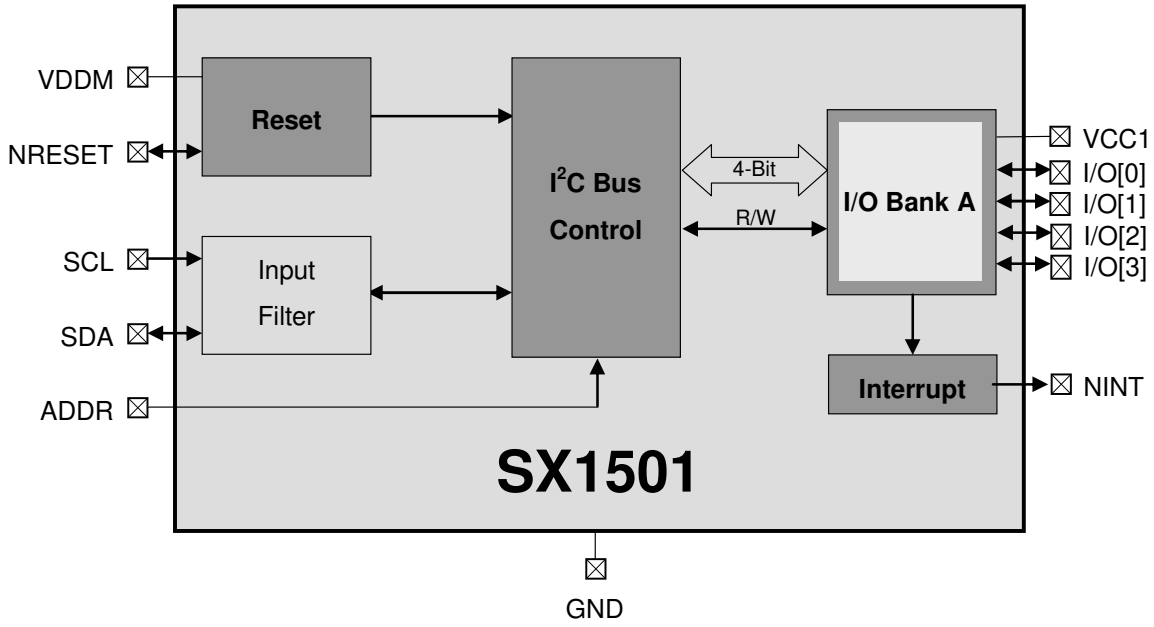

Figure 4 – 4-channel Low Voltage GPIO

4.2 SX1502 8-channel GPIO

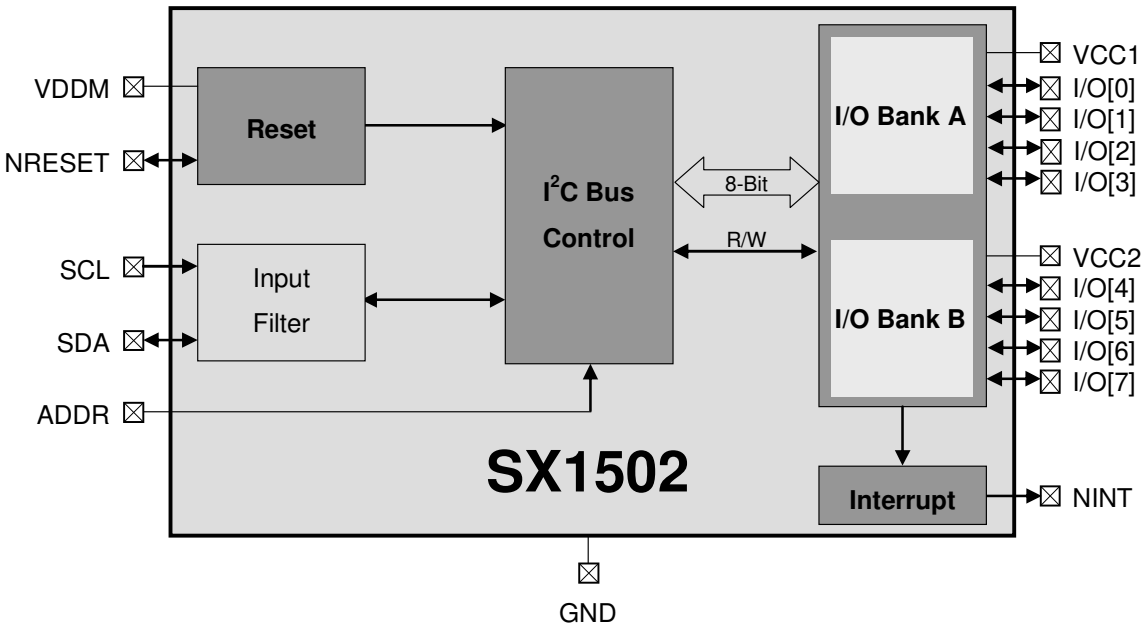

Figure 5 – 8-channel Low Voltage GPIO

4.3 SX1503 16-channel GPIO

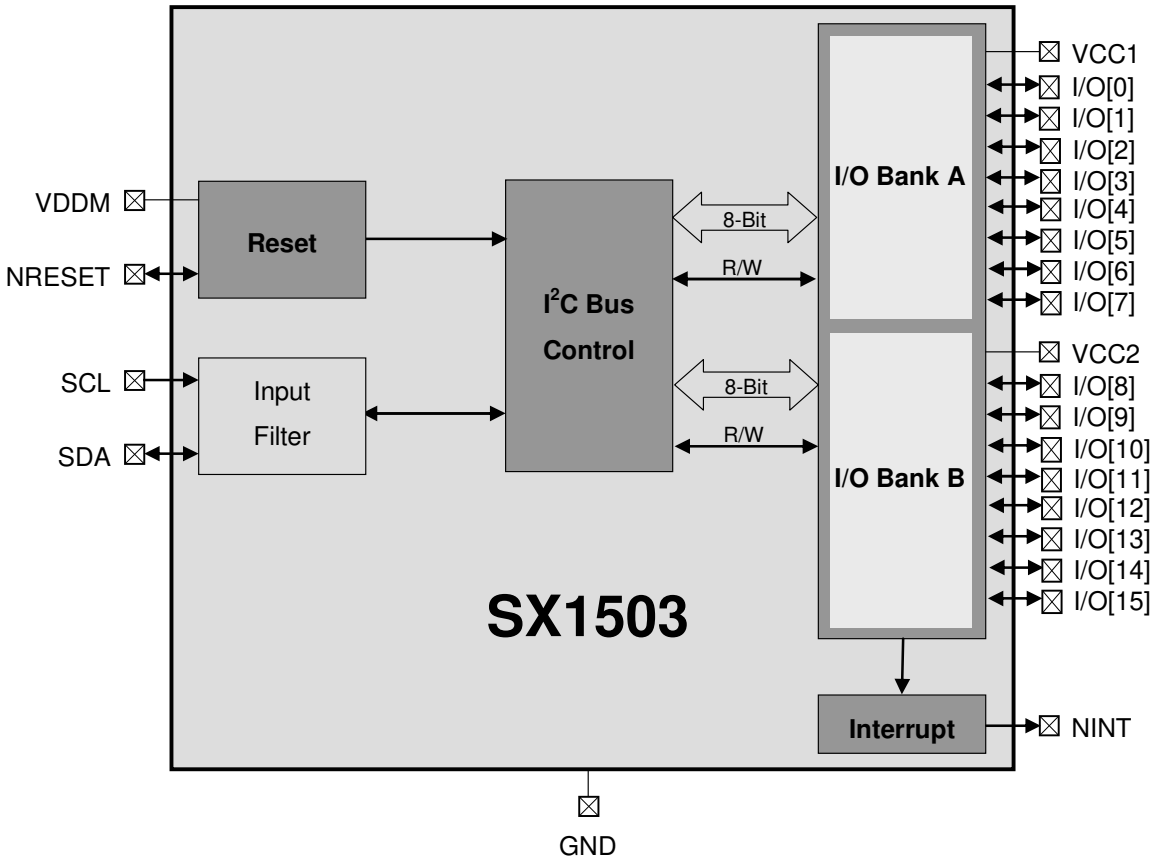

Figure 6 – 16-channel Low Voltage GPIO

4.4 Reset (NRESET)

The SX1501, SX1502 and SX1503 generate their own power on reset signal after a power supply is connected to the VDDM pin. The reset signal is made available for the user at the pin NRESET. The rising edge of the NRESET indicates that the startup sequence of the SX1501, SX1502 or SX1503 has finished. NRESET must be connected to VDDM (or greater) either directly, or via a resistor.

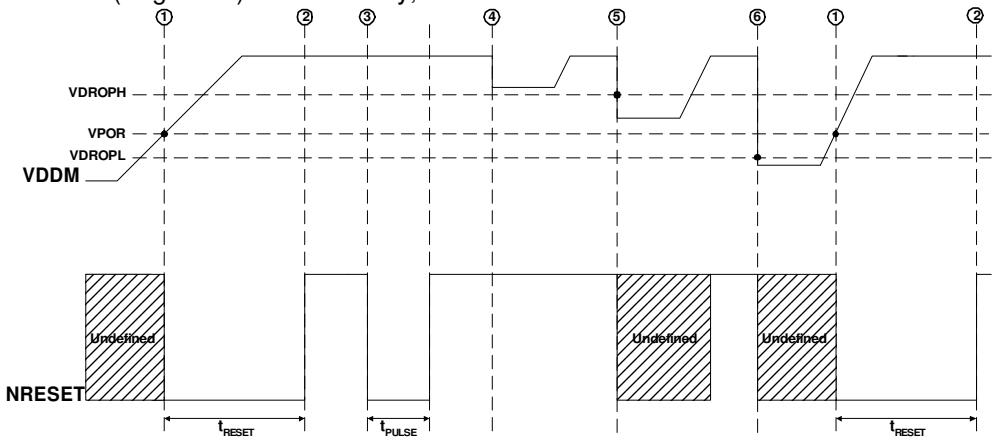

Figure 7 – Power-On / Brown-out Reset Conditions

1. Device behavior is undefined until VDDM rises above VPOR, at which point NRESET is driven to GND by the SX1501, SX1502 or SX1503.
2. After t_{RESET}, NRESET is released (high-impedance) by the SX1501, SX1502 or SX1503 to allow it to be pulled high by an external resistor.
3. In operation, the SX1501, SX1502 and SX1503 may be reset at anytime by an external device driving NRESET low during t_{PULSE}. Chip can be accessed normally again after NRESET rising edge.

4. During a brown-out event, if VDDM drops above VDROPH a reset will not occur.
5. During a brown-out event, if VDDM drops between VDROPH and VDROPL a reset may occur.
6. During a brown-out event, if VDDM drops below VDROPL a reset will occur next time VPOR is crossed.

Please note that a brown-out event is defined as a transient event on VDDM. If VDDM is attached to a battery, then the gradual decay of the battery voltage will not be interpreted as a brown-out event.
Please also note that a sharp rise in VDDM (> 1V/us) may induce a circuit reset.

4.5 2-Wire Interface (I^2C)

The SX1501, SX1502 and SX1503 2-wire interface (I^2C compliant) operates only in slave mode. In this configuration, the device has one or two device addresses defined by ADDR pin.

Device	ADDR Pin	I^2C Address	Description
SX1501 & SX1502	**0**	0x2**0** (0100000)	First address of the 2-wire interface
	1	0x2**1** (0100001)	Second address of the 2-wire interface
SX1503		0x20 (0100000)	Fixed address of the 2-wire interface

Table 7 - 2-Wire Interface Address

2 lines are used to exchange data between an external master host and the slave device:

- **SCL** : **S**erial **CL**ock
- **SDA** : **S**erial **DA**ta

The SX1501, SX1502 and SX1503 are read-write slave-mode I^2C devices and comply with the Philips I^2C standard Version 2.1 dated January, 2000. The SX1501, SX1502 and SX1503 have respectively 12, 16, and 31 user-accessible internal 8-bit registers. The I^2C interface has been designed for program flexibility, in that once the slave address has been sent to the SX1501, SX1502 or SX1503 enabling it to be a slave transmitter/receiver, any register can be written or read independently of each other. While there is no auto increment/decrement capability in the SX1501 and SX1502 I^2C logic, a tight software loop can be designed to access the next register independent of which register you begin accessing. SX1503 implements auto increment capability. The start and stop commands frame the data-packet and the repeat start condition is allowed if necessary.

Seven bit addressing is used and ten bit addressing is not allowed. Any general call address will be ignored by the SX1501, SX1502 and SX1503. The SX1501, SX1502 and SX1503 are not CBUS compatible and can operate in standard mode (100kbit/s) or fast mode (400kbit/s).

4.5.1 WRITE

The simplest format for an I^2C write is given below. After the start condition [S], the slave address is sent, followed by an eighth bit indicating a write. The I^2C then acknowledges that it is being addressed, and the master responds with an 8 bit data byte consisting of the register address. The slave acknowledges and the master sends the appropriate 8 bit data byte. Once again the slave acknowledges and the master terminates the transfer with the stop condition [P].

Slave Address: 7 bit
Register Address: 8 bit
Data: 8 bit

Figure 8 - 2-Wire Serial Interface, Write Register Operation

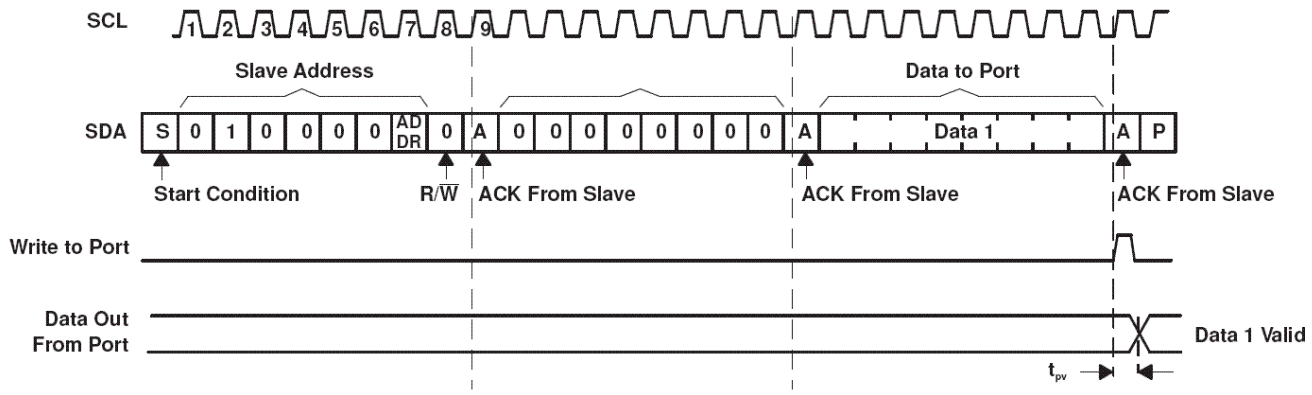

Figure 9 – Write RegData Register

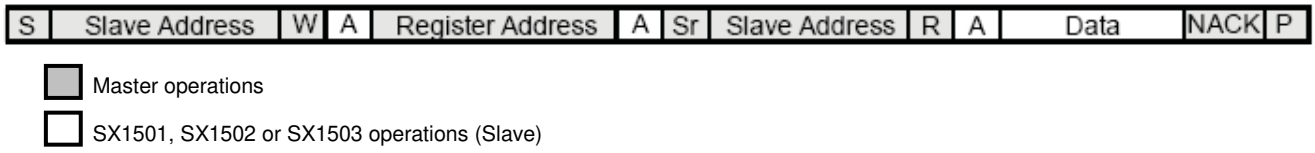
Please note that SX1503 implements register address auto-increment i.e. after the Data ACK from Slave the master can write further bytes and the interface will handle the register address increment automatically. Finally the master terminates the transfer normally the stop condition [P].

4.5.2 READ

After the start condition [S], the slave address is sent, followed by an eighth bit indicating a write. The I^2C then acknowledges that it is being addressed, and the master responds with an 8 bit data byte consisting of the register address. The slave acknowledges and the master sends the repeated start condition [Sr]. Once again, the slave address is sent, followed by an eighth bit indicating a read. The slave responds with an acknowledge and the previously addressed 8 bit data byte; the master then sends a non-acknowledge (NACK). Finally, the master terminates the transfer with the stop condition [P].



S: Start Condition
W: Write = '0'
R: Read = '1'
A: Acknowledge (sent by slave)
NACK: Non-Acknowledge (sent by master)
Sr: Repeated Start Condition
P: Stop condition

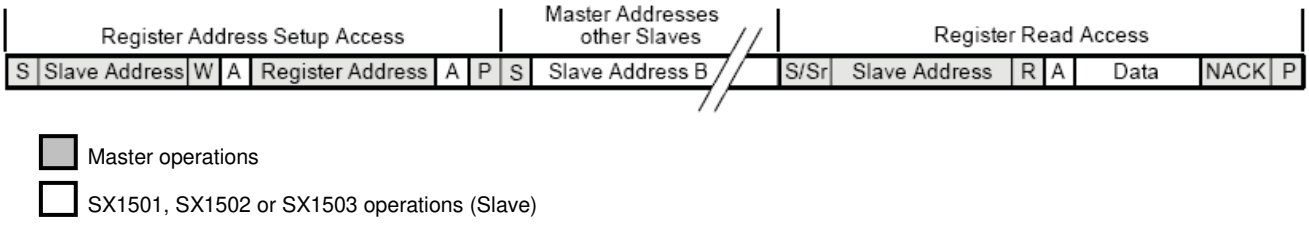
Slave Address: 7 bit
Register Address: 8 bit
Data: 8 bit

Figure 10 - 2-Wire Serial Interface, Read Register Operation

Please note that SX1503 implements register address auto-increment i.e. after the Data byte from Slave the master can acknowledge (ACK) to indicate that it wants to read the next byte and the interface will handle the register address increment automatically. Finally the master terminates the transfer normally with a NACK followed by the stop condition [P].

4.5.3 READ - STOP separated format (SX1501 and SX1502 only)

When operating SX1501 or SX1502, stop-separated reads can also be used. This format allows a master to set up the register address pointer for a read and return to that slave at a later time to read the data. In this format the slave address followed by a write command are sent after a start [S] condition. The slave then acknowledges it is being addressed, and the master responds with the 8-bit register address. The master sends a Stop or Restart condition and may then address another slave. After performing other tasks, the master can send a start or restart condition to the slave with a read command. The slave acknowledges this request and returns the data from the register location that had previously been set up.



S: Start Condition
W: Write = '0'
R: Read = '1'
A: Acknowledge (sent by slave)
NACK: Non-Acknowledge (sent by master)
Sr: Repeated Start Condition
P: Stop condition

4.6 Interrupt (NINT)

At start-up, the transition detection logic is reset, and NINT is released to a high-impedance state. The interrupt mask register is set to 0xFF, disabling the interrupt output for transitions on all I/O ports. The transition flags are cleared to indicate no data changes.

An interrupt NINT can be generated on any programmed combination of I/Os rising and/or falling edges through the RegInterruptMask and RegSense registers.
If needed, the I/Os which triggered the interrupt can then be identified by reading RegInterruptSource register.

When NINT is low (i.e. interrupt occurred), it can be reset back high (i.e. cleared) by writing 0xFF in RegInterruptSource (this will also clear corresponding bits in RegEventStatus register).
SX1503 also allows the interrupt to be cleared automatically when reading RegData register (Cf. RegAdvanced)

Example: We want to detect rising edge of I/O[1] on SX1502 (NINT will go low).

1. *We enable interrupt on I/O[1] in RegInterruptMask*
   ⇨ *RegInterruptMask ="XXXXXX**0**X"*

2. *We set edge sense for I/O[1] in RegSense*
   ⇨ *RegSenseLow ="XXXX**01**XX"*

4.7 Programmable Logic Functions (PLD)

The SX1501, SX1502 and SX1503 offer a unique fully programmable logic functions like a PLD to give more flexibility and reduce external logic gates used for standard applications.
Since the whole truth table is fully programmable, the SX1501, SX1502, and SX1503 can implement combinatory functions ranging from the basic AND/OR gates to the most complicated ones with up to four 3-to1 PLDs or two 3-to-2 PLDs which can also be externally cascaded if needed.

In all cases, any IO not configured for PLD functionality retains its GPIO functionality while I/Os used by the PLD have their direction automatically set accordingly.
Please note that while RegDir corresponding bits are ignored for PLD operation they may still be set to input to access unused PLD inputs as normal GPI (PLD truth table can define some inputs to have no effect on PLD output) and/or generate interrupt based on any of the PLD inputs or outputs bits.

4.7.1 SX1501

The SX1501 I/Os can be configured to provide any combinational 2-to-1 logic function using I/O[0-2] whilst retaining GPIO capability on I/O[3] OR provide a combinational 3-to-1 decode function using all 4 I/O ports.

4.7.4 Tutorial

The generic method described in this paragraph can be applied to any of the SX1501, SX1502 or SX1503.
Example: We want to implement an AND gate between I/O[0] and IO[1] on SX1502

1. Identify in the tables above the RegPLDMode setting to be programmed.
   *What we need corresponds to the second line of the SX1502 PLD Table => RegPLDMode = "xx00xx**01**"*
2. Fill corresponding RegPLDTableX with the wanted truth table.
   As mentioned in RegPLDMode description, using PLD 2-to-1 mode on I/0[0-2] implies to fill the truth table located in RegPLDTable0(3:0)

I/O[1]	*I/O[0]*	*I/O[2]*
0	*0*	***0***
0	*1*	***0***
1	*0*	***0***
1	*1*	***1***

*=> RegPLDTable0 = "xxxx**1000**"*

Table 16 – SX1503 Configuration Registers Overview

Addr	Name	Default	Bits	Description

Addr	Name	Default	Bits	Description	
0x00	**RegDataB**	0xFF	7:0	Write: Data to be output to the output-configured IOs Read: Data seen at the IOs, independent of the direction configured.	
0x01	**RegDataA**	0xFF	7:0	Write: Data to be output to the output-configured IOs Read: Data seen at the IOs, independent of the direction configured.	
0x02	**RegDirB**	0xFF	7:0	Configures direction for each IO. 0 : IO is configured as an output 1 : IO is configured as an input	
0x03	**RegDirA**	0xFF	7:0	Configures direction for each IO. 0 : IO is configured as an output 1 : IO is configured as an input	
0x04	**RegPullUpB**	0x00	7:0	Enables the pull-up for each IO 0 : Pull-up is disabled 1 : Pull-up is enabled	
0x05	**RegPullUpA**	0x00	7:0	Enables the pull-up for each IO 0 : Pull-up is disabled 1 : Pull-up is enabled	
0x06	**RegPullDownB**	0x00	7:0	Enables the pull-down for each IO 0 : Pull-down is disabled 1 : Pull-down is enabled	
0x07	**RegPullDownA**	0x00	7:0	Enables the pull-down for each IO 0 : Pull-down is disabled 1 : Pull-down is enabled	
0x08	**RegInterruptMaskB**	0xFF	7:0	Configures which [input-configured] IO will trigger an interrupt on NINT pin 0 : An event on this IO will trigger an interrupt 1 : An event on this IO will NOT trigger an interrupt	
0x09	**RegInterruptMaskA**	0xFF	7:0	Configures which [input-configured] IO will trigger an interrupt on NINT pin 0 : An event on this IO will trigger an interrupt 1 : An event on this IO will NOT trigger an interrupt	
0x0A	**RegSenseHighB**	0x00	7:6	Edge sensitivity of I/O[15]	00 : None 01 : Rising 10 : Falling 11 : Both
			5:4	Edge sensitivity of I/O[14]

			5:4	Edge sensitivity of I/O[2]	
			3:2	Edge sensitivity of I/O[1]	
			1:0	Edge sensitivity of I/O[0]	
0x0E	**RegInterruptSourceB**	0x00	7:0	Interrupt source (from IOs set in RegInterruptMaskB) 0 : No interrupt has been triggered by this IO 1 : An interrupt has been triggered by this IO (an event as configured in relevant RegSense register occured). Writing '1' clears the bit in RegInterruptSourceB and in RegEventStatusB When all bits of both RegInterruptSourceA/B are cleared, NINT signal goes back high.	
0x0F	**RegInterruptSourceA**	0x00	7:0	Interrupt source (from IOs set in RegInterruptMaskA) 0 : No interrupt has been triggered by this IO 1 : An interrupt has been triggered by this IO (an event as configured in relevant RegSense register occured). Writing '1' clears the bit in RegInterruptSourceA and in RegEventStatusA When all bits of both RegInterruptSourceA/B are cleared, NINT signal goes back high.	
0x10	**RegEventStatusB**	0x00	7:0	Event status of all IOs. 0 : No event has occured on this IO 1 : An event has occured on this IO (an edge as configured in relevant RegSense register occured). Writing '1' clears the bit in RegEventStatusB and in RegInterruptSourceB if relevant. If the edge sensitivity of the IO is changed, the bit(s) will be cleared automatically
