

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Precision Diode Digital Temperature For Up To 3 External Sensors

General Description

The SX8733, SX8743 and SX8744 are digital temperature sensors with a 2-wire SMBus interface. It provides a low-cost solution to monitor the temperature of remote diodes as well as its own temperature with an on-chip PN junction sensor.

Depending on the device version, 2, 3 or 4 programmable ports are included. They offer the possibility to trig under- / over- temperature alarms which can be used as an interrupt or to connect up to 3 external sensors in single-ended mode or 2 external sensors in differential mode.

The parasitic resistances in series with the temperature monitoring diode can be cancelled by an algorithmic, a 3-point or a Kelvin (4-wire) method.

The SX8744 is pin-to-pin compatible with the LM86 part.

The SX8733 (2 programmable ports) is available in MLPD-6 package. The SX8743 (4 programmable ports) and SX8744 (3 programmable ports) are available in MSOP-8 package.

Applications

- ◆ Printer
- ◆ Server
- ◆ Set Top Box
- ◆ Projector
- ◆ Batteries charger monitoring

Key Product Features

- ◆ 1 Internal and Up To 3 External Sensors
- ◆ Remote Diode Temp. Accuracy of $\pm 0.5^{\circ}\text{C}$ on the Temp. Range 25°C to 100°C
- ◆ 2 Temp. Output Formats: 0°C to 127°C and -40°C to 140°C With 0.125°C Resolution
- ◆ Parasitic Series Resistance Cancellation: Algorithmic, 3-point and Kelvin (4-wire)
- ◆ Under- / Over- Temp. Alarms With Programmable Thresholds
- ◆ Programmable Conversion Rate For Optimal Power Consumption
- ◆ 250 uA Active Current @ 10Hz Sampling Rate
- ◆ SMBus v2.0 Interface Supports TIMEOUT
- ◆ Pb-Free, Halogen Free, RoHS/WEEE Compliant Product

 2. Specification with $V_{DD}=3.0\text{V}$ to 3.6V and track resistance cancellation disabled.

1.4. SMBus Timing Characteristics

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
SMBus clock frequency	f_{SMB}		10		400	kHz
SMBus clock low time	t_{LOW}		1.3			us
SMBus clock high time	t_{HIGH}		0.6			us
SMBus rise time	$t_{\text{R,SMB}}$				300	ns
SMBus fall time	$t_{\text{F,SMB}}$				300	ns
SMBDAT and SMBCLK time low for reset of serial interface	t_{TIMEOUT}		25		35	ms
Data setup time	$t_{\text{SU,DAT}}$		100			ns
Data hold time ¹	$t_{\text{HD,DAT}}$		0			ns
Start condition hold time (SMBDAT low to SMBCLK low)	$t_{\text{HD,STA}}$		0.6			us
Stop condition hold time (SMBCLK high to SMBDAT high)	$t_{\text{SU,STO}}$		0.6			us
Repeated start-condition setup time (SMBCLK high to SMBDAT low)	$t_{\text{SU,STA}}$		0.6			us
SMBus free time between stop and start conditions	t_{BUF}		1.3			us

1. The device provides a hold time of at least 300ns for the SMBDAT signal to bridge the undefined region of the falling edge of SMBCLK.

Table 3 Programmable Pin Description

3. Configuration

3.1. General Presentation

SX8733 / SX8743 / SX8744 include an on-chip PN junction to measure local temperature T_J .

The device has a 2-level current source and an ADC to measure each diode's forward voltage to compute the temperature. The input multiplexer allows 3 external and 1 internal sensors to be connected to the ADC.

Two alarms can provide to the system the information that a sensor temperature has reached the programmable threshold.

The chip is configured with a 2-wire SMBUS serial line.

The functional diagram is shown in Figure 2.

Figure 2. Functional Diagram

3.2. Modes

The mode set in *RegConfig* allows numerous circuit configurations described in Figure 3 and Figure 4.

Up to 3 external sensors can be connected. These are configured with differential or single-ended connections.

Some modes provide a track resistance cancellation feature to decrease temperature inaccuracy linked to long PCB traces connecting the external sensor to the chip. This is set in *RegControl* (bits *Point3* or *Algo*). Table 4 presents the mode for the SX8743.

Mode	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	20
External sensor	1	1	1	0	2	2	1	1	1	1	1	2	2	2	2	3	3	3	3	1
Differential	x	x							x	x		x	x							x
Single-ended			x		x	x	x	x			x			x	x	x	x	x	x	
Algorithmic track resistance cancellation		x				x		x		x			x		x				x	
3-point track resistance cancellation			x								x					x				x
Kelvin (4-wire) track resistance cancellation																				x
Alarm #	0	0	0	2	0	0	1	1	2	2	2	0	0	2	2	1	1	1	0	0

Table 4 Features Available With SX8743

Due to their limited number of ports, SX8733 and SX8744 do not offer all these features. SX8733 does not provide ports P3 and P4 so modes 8 to 20 should not be used. Also port P3 is not available on SX8744 and this typically reduces the number of alarm or the number of external sensors.

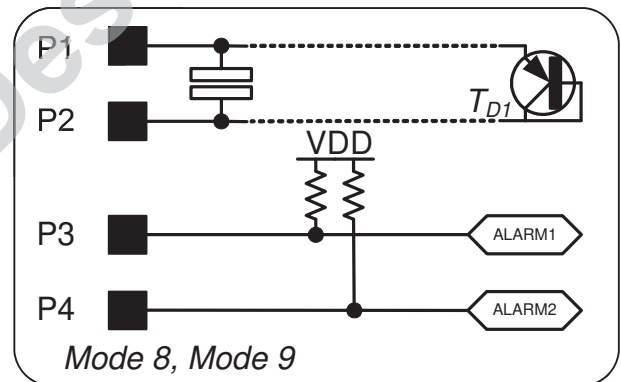

Figure 3. Mode Connection Diagrams (Modes 0 to 12)

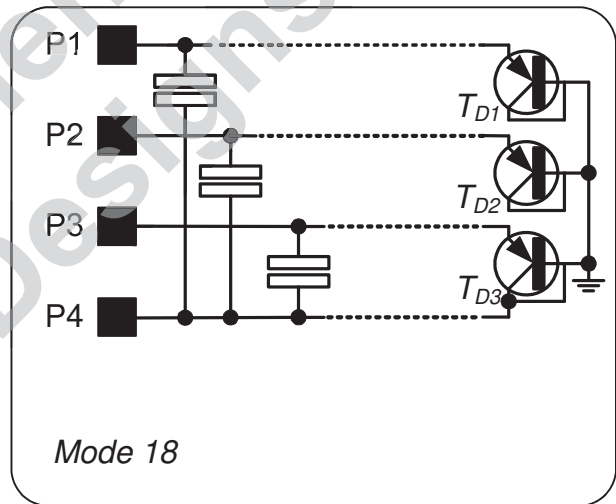

Figure 4. Mode Connection Diagrams (Modes 13 to 18 and 20)

3.3. Differential and Single-Ended External Sensor

Table 4 indicates whether the external sensors are connected differentially or in single-ended configuration with grounded cathode.

Differential modes have better common-mode rejection of external noise pickup. The external noise pickup is present equally on the anode and the cathode therefore differential noise is minimized.

Single-ended modes allow more sensors to be connected to the chip but they are more prone to noise pickup since the cathode is connected to a common VSS and, therefore, any external noise pickup tends to be developed mainly across the anode which will be measured as temperature noise.

A filtering capacitor is recommended to decrease measurement noise especially if the external sensor is connected to the chip by a long trace. A capacitor with a value of 100 pF should be placed as close as possible to the chip pins.

3.4. Measurement Principle

The circuit uses the intrinsic thermal property of a diode to measure temperature. Temperature is calculated by measuring the base-emitter voltage of a transistor. Two different currents are sourced to the diodes. The base-emitter voltage is measured in each case. With a fixed current ratio, temperature is accurately calculated by measuring the difference in the base-emitter voltage at the two currents.

The excitation current I_2 of 100uA is passed through the diode first. The base-emitter voltage of the transistor is measured by the ADC. The measurement is then repeated using the excitation current divided by a fixed value. This current I_1 has a value of 10uA. The following equation relates the V_{BE} difference voltage with current and temperature T where:

- ◆ k is the Boltzmann's constant (1.381×10^{-23} J/K)
- ◆ q is the charge on the electron (1.602×10^{-19} Cb).
- ◆ T_{abs} is the absolute temperature in Kelvins. ($T_{abs}=273.15 + T$ where T is the temperature in Celsius).
- ◆ n is the pn junction ideality factor (1.00 for an ideal diode)

$$\Delta V_{BE} = V_{BE2} - V_{BE1} = n \cdot \frac{kT_{abs}}{q} \ln\left(\frac{I_2}{I_1}\right)$$

For a current ratio $I_2/I_1=10$ and an ideality factor $n=1.010$, this gives a fixed relationship between ΔV_{BE} and temperature of 200uV/°C. The voltage is then converted to digital with an ADC.

3.5. Parasitic Track Resistance Cancellation

The temperature measurement method described previously assumes a very low series impedance in the sensor path. With a typical ΔV_{BE} around 200uV/°C and the $\Delta I=I_2-I_1=90\mu A$, 1 ohm of parasitic resistance in the sensor path gives approximately 0.45°C of temperature error. This may result in a significant error if the external sensor is located some distance away from the chip. Track resistance cancellation schemes decrease temperature error due to high resistance in the tracks from the device to the sensors.

$$\Delta T_{Rtrack} = R_{Track} \cdot \frac{I_2 - I_1}{200\mu V/C}$$

3.5.1. Algorithmic Track Resistance Cancellation

The use of the algorithmic track resistance cancellation allows automatic cancellation of resistances in series with the temperature diode by using current modulation to bias the external diode. This is done transparently to the user. This method may cancel up to 1 kOhm of series resistance. The best accuracy is in the T_D range 20°C to 70°C.

3.5.2. 3-Point Track Resistance Cancellation

The 3-point track resistance cancellation requires one additional connection to the external PN junction so that an additional current source can be used to cancel out the error voltage due to the track resistance.

Track resistances up to 1 kOhm may be cancelled. It is important that the track resistance values in the cathode or anode path of the external sensor are made equal. Care must be taken during PCB layout to match track resistances between the device and the sensor. Any resistance difference will lead to cancellation errors.

In this mode, VSS is used for the current return path from the cathode. This connection must be placed close to the diode's cathode. One port supply the current modulation to the anode and another port supply the cancellation current to the cathode. The resulting junction voltage modulation is measured between the 2 used ports. Figure 5 explains the method:

Assume sensor Q1 is being measured in mode 2 with 3-point track resistance cancellation enabled. The PCB trace linking the device to the external sensor must be matched which means the PCB track resistance are the same. The same current is forced out of P1 and P2.

The voltages developed on P1 and P2 traces are the same therefore the differential voltage seen on P1-P2 is not impacted by the track resistance.

Figure 5. 3-Point Track Resistance Cancellation

3.5.3. The Kelvin (4-wire) Track Resistance Cancellation

The sensor is connected to the chip via 4 wires. Two comes from the current source (force : P3, P4) and two are used for the voltage measurement (sense : P1, P2).

The Kelvin connection avoids the measurement error caused by the voltage drop in the force path.

Sense leads are attached directly across the external sensor. The P1 and P2 connections must be as close as possible to sensor anode and cathode respectively.

Figure 6. Kelvin (4-wire) Track Resistance Cancellation

3.6. Temperature Acquisition Sequence

The SX8743 monitors up to 4 sensors (3 remote and 1 internal). These can be scanned in sequence to make an automatic reading of the sensors one after the other. The result of each conversion is stored in the temperature registers (see Table 6). The register *RegSensor* defines which sensors are scanned in the sequence. When all the sensors are selected, the sequence is the following: Int→ Ext1→ Ext2→ Ext3→ Int→etc.

3.7. Alarm

Alarm threshold registers (*RegAlarm1* and *RegAlarm2*) contain the value the user wishes the alarms to trip on. The alarm data format is the same as the temperature data format which is set in *RegControl* (bit *TempOffsetMode*). In other words, in binary mode alarm value is set in degree; in offset binary mode alarm is set in with an offset of 64. The alarm calculation is performed at the end of the temperature sensing cycle. Therefore, if *TempOffsetMode* bit or alarm values are changed, a temperature sensor measurement must be run to update the alarm outputs.

Depending on the selected mode, the chip can have two alarm outputs: Alarm1 and Alarm2. If the external or internal temperature exceeds or goes under a programmed temperature threshold, the alarm is activated. Any remote or local sensor may be selected to trigger Alarm1 and Alarm2.

Figure 7. Alarm Output Internal Simplified Schematics

The pseudo-open drain output shown in Figure 7 requires a pull-up resistor connected to VDD. It allows connection to a GPIO, a system shutdown or other thermal management circuitry.

The alarm polarity can be set active low or high and, the over or under temperature can also be set with *RegAlarmSet* register.

To prevent alarm outputs to trig constantly when the limit temperature is reached, the *RegAlarmHyst* register holds a hysteresis value. The alarm remains active while the temperature is superior to the alarm threshold minus the value programmed in the *RegAlarmHyst* register (for a trig on over-temperature) as described on Figure 8.

Figure 8. Alarm Output

3.8. Temperature Data Format

Temperature output code from the internal and external sensors are made of 2 bytes. The temperature high byte has an LSB representing 1°C and contains the integer part of the temperature while the low byte contains the fractional value with a resolution of 0.125°C.

The SX8733 has 2 temperature data formats. By default, the format is binary and the measurement range is from 0°C to 127°C. To extend the measurement range to -40°C to +140°C, an offset of 64°C is added to the binary code.

When a conversion is complete, the main temperature register and the extended temperature register are updated simultaneously. Ensure that no conversions are completed between reading the main register and the extended register, so that both registers contain the result of the same conversion.

Temperature High Byte			Temperature Low Byte	
Temperature (°C)	Binary	Offset Binary ¹	Temperature (°C)	Binary or Offset Binary
-40 or less	0000 0000 ²	0001 1000	x.000	0000 0000
0	0000 0000	0100 0000	x.125	0000 0001
1	0000 0001	0100 0001	x.250	0000 0010
50	0011 0010	0111 0010	x.375	0000 0011
64	0100 0000	0000 0000	x.500	0000 0100
100	0110 0100	1010 0100	x.625	0000 0101
127	0111 1111	1011 1111	x.750	0000 0110
140 or more	0111 1111 ³	1100 1100	x.875	0000 0111
Diode fault	1111 1111 ⁴	1111 1111 ⁴		

1. Offset binary scale temperature values are offset by 64°C
2. Binary scale returns 0°C for all temperatures <0°C
3. Binary scale returns 127°C for all temperatures >127°C
4. A diode fault is detected when the temperature ADC hard limits at 0% or 100% pulse density

3.9. Continuous Time Vs. Single Shot

The chip can be operated in 2 distinct modes: continuous time or one-shot.

The one-shot mode performs one temperature measurement of all sensors selected in *RegSensor*. After completion, it returns to standby.

In continuous temperature sampling, temperature measurements are taken at regular intervals and the result held in internal registers accessible by SMBUS. The *RegADCRate* register controls the sampling time period.

4. Application Note

4.1. Typical Temperature Sensing System With A SX8743

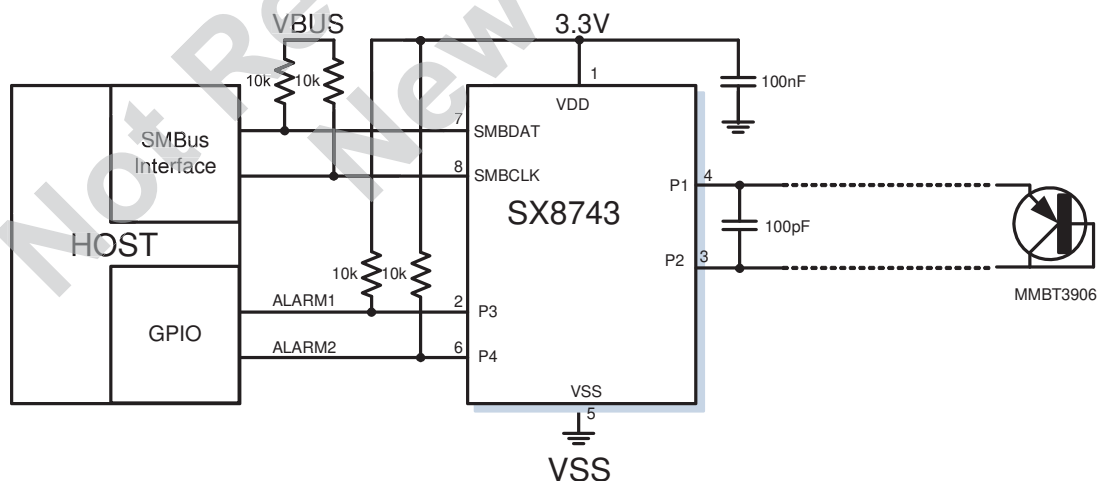

Figure 9. SX8743 Performs Remote Temperature Measurement In Mode 8

When the remote-sensing diode is a discrete transistor, its collector and base should be connected together. An external capacitor of 100pF across the PN junction smoothes out external noise interference. The capacitor must be located very close to the pins.

The ideality factor is a measure of the deviation of the thermal diode from ideal behavior. The chips are trimmed for the PNP device described in Table 5.

A different ideality factor causes a change in the slope of the linear equation $\Delta V_{BE}=f(T)$.

Gain and offset can be adjusted with the registers *RegExtGain* and *RegExtOffset* to compensate for small variations in n. Large power transistors must not be used.

$$\Delta T_{nfact} = \left(\frac{n_{nom}}{n_{actual}} - 1 \right) \cdot (T_D + 273.15)$$

Part Number	Manufacturer	Package
MMBT3906	Fairchild	SOT23-3

Table 5 Recommended device

5. Power-Up Sequence and Standby Mode

A fast rise of the power supply at power-up is required to ensure a safe start. The rise time must meet the timing described in Figure 10

At power-up, the device is in one-shot mode waiting for an SMBUS command to start conversion.

The measurement interval and the alarm thresholds will default to a set value at power-up but may be reconfigured to different values with SMBUS command.

Between temperature measurements, to decrease power consumption, the chip will shut down into its low-power standby state with most functions disabled.

Figure 10. Power supply rise time

6. Serial Interface

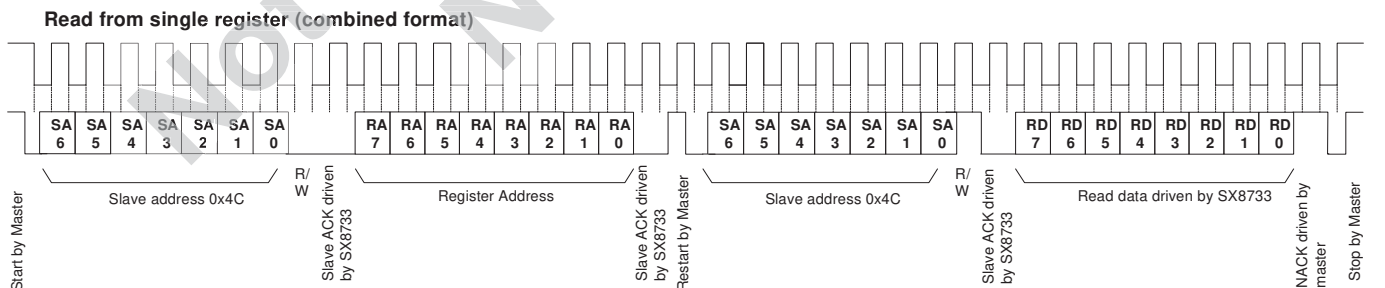

6.1. Register Write - Combined Format

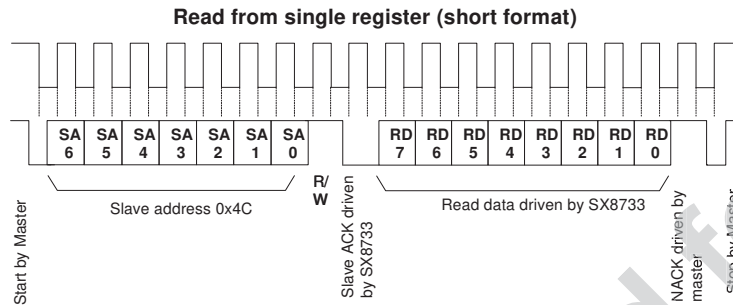

6.2. Register Write - Direct Format

6.3. Register Read - Combined Format

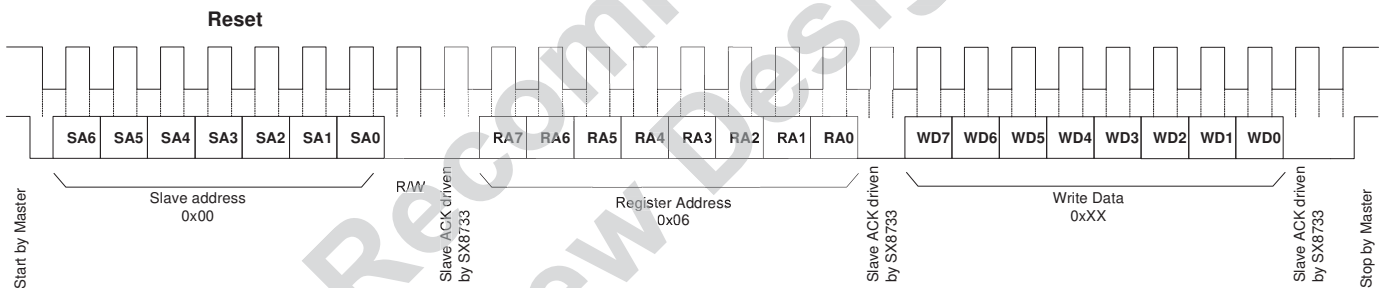

6.4. Register Read - Direct Format

6.5. Soft Reset

The user may reset the circuit via SMBus by sending a general call address at slave address 0x00 followed by the reset command 0x06. In other words, as illustrated in the figure below, a soft reset can be generated by sending a command at slave address 0x00 (rather than the regular 0x4C slave address) to IC register address 0x06 with any data (0xXX). The soft reset command sets the circuit and registers in the same state as after a power-up.

7. Register / Memory Map

Each register is described in the following register memory map. These are identified by a Register Name and corresponding hexadecimal register address.

7.1. Memory Map

Identification Registers		
0x00	RegConfig	Determines the chip variant and the communication interface (I2C or SMBus)
0x06	RegExtGain	Sets the calibration gain for remote temperature measurement
0x07	RegExtOffset	Sets the calibration offset for remote temperature measurement
0x20	RegDeviceID	Read-only ID = 0x33
0x21	RegDeviceVersion	Read-only circuit revision
Configuration Registers		
0x22	RegSensor	Defines which sensors are scanned in sequence
0x23	RegAlarm1	Alarm1 threshold
0x24	RegAlarm2	Alarm2 threshold
0x25	RegAlarmSet	Defines which sensors control alarms 1 and 2, and whether over-/under- temperature triggers for each alarm
0x26	RegAlarmHyst	Alarm hysteresis
0x27	RegADCRate	Temperature conversion rate
Temperature Registers		
0x28	RegIntTempMSB	T_J temperature reading for internal sensor, integer part, LSB = 1°C
0x29	RegIntTempLSB	T_J temperature reading for internal sensor, fractional part, LSB = 0.125°C
0x2A	RegExtTemp1MSB	T_{D1} temperature reading for external sensor 1, integer part, LSB = 1°C
0x2B	RegExtTemp1LSB	T_{D1} temperature reading for external sensor 1, fractional part, LSB = 0.125°C
0x2C	RegExtTemp2MSB	T_{D2} temperature reading for external sensor 2, integer part, LSB = 1°C
0x2D	RegExtTemp2LSB	T_{D2} temperature reading for external sensor 2, fractional part, LSB = 0.125°C
0x2E	RegExtTemp3MSB	T_{D3} temperature reading for external sensor 3, integer part, LSB = 1°C
0x2F	RegExtTemp3LSB	T_{D3} temperature reading for external sensor 3, fractional part, LSB = 0.125°C
General Registers		
0x30	RegControl	General Control register
0x31	RegStatus	General Status register

1. write logic 1 to register bit to clear

8. Packaging Information

8.1. MLPD-W6-EP2 Package Outline Drawing

NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS TERMINALS.

8.2. MLPD-W6-EP2 Land Pattern Drawing

DIMENSIONS	
DIM	MILLIMETERS
C	(2.95)
G	2.20
H	1.65
K	2.38
P	0.95
R	0.225
X	0.45
Y	0.75
Z	3.70

NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. THIS LAND PATTERN IS FOR REFERENCE PURPOSES ONLY. CONSULT YOUR MANUFACTURING GROUP TO ENSURE YOUR COMPANY'S MANUFACTURING GUIDELINES ARE MET.
3. THERMAL VIAS IN THE LAND PATTERN OF THE EXPOSED PAD SHALL BE CONNECTED TO A SYSTEM GROUND PLANE. FAILURE TO DO SO MAY COMPROMISE THE THERMAL AND/OR FUNCTIONAL PERFORMANCE OF THE DEVICE.

8.3. Package Outline Drawing: MSOP-8

NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. DATUMS **-A-** AND **-B-** TO BE DETERMINED AT DATUM PLANE **-H-**
3. DIMENSIONS "E1" AND "D" DO NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS.
4. REFERENCE JEDEC STD MO-187, VARIATION AA.

8.4. Land Pattern Drawing: MSOP-8

DIMENSIONS		
DIM	INCHES	MILLIMETERS
C	(.161)	(4.10)
G	.098	2.50
P	.026	0.65
X	.016	0.40
Y	.063	1.60
Z	.224	5.70

NOTES:

1. THIS LAND PATTERN IS FOR REFERENCE PURPOSES ONLY. CONSULT YOUR MANUFACTURING GROUP TO ENSURE YOUR COMPANY'S MANUFACTURING GUIDELINES ARE MET.
