## DESCRIPTION

The SY88902 is a high speed current switch for driving a semiconductor laser diode in optical transmission applications. The output current, or modulation current  $I_{MOD}$ , is DC current controlled by  $I_{RSET}$ , current through the resistor  $R_{SET}$ . The output  $OUT$  is HIGH when output enable is HIGH.

The device incorporates complementary open collector outputs with a capability of driving peak current of 25mA. The resistor  $R_{EXT}$  must be placed between  $\overline{OUT}$  and  $V_{CC}$  to dissipate the worst case power.  $R_{SER}$  is recommended to compensate for laser diode matching issues.

The SY88902 utilizes the high performance bipolar ASSET™ technology.

**PIN NAMES**

Pin	Function
VCC	Most positive power supply input, +5V for PECL operation.
GND	Ground
DIN, /DIN	These differential PECL 100K compatible inputs receive NRZ data.
/EN	This PECL 100K compatible input enables Laser Driver. Modulation current goes to zero when asserted HIGH.
OUT, /OUT	Open collector outputs from the modulation buffer drive these differential current outputs.
VREF	Voltage reference for use with RSET.
RSET	An external resistor sets up the source current for modulation $I_{mod}$ .
