### DESCRIPTION

The SY89321L is a differential LVPECL/CML/LVDS-to-LVTTL translator requiring only a single +3.3V power. The SY89321L is functionally equivalent to the SY100EPT21L, but in an ultra-small 8-pin MLF® package that features a 70% smaller footprint. This ultra-small package and low skew single gate design make the SY89321L ideal for applications that require the translation of a clock or data signal where minimal space, low power and low cost are critical.

$V_{BB}$  allows a differential, single-ended, or AC-coupled interface to the device. If used, the  $V_{BB}$  output should be bypassed to  $V_{CC}$  with 0.01 $\mu$ F capacitor.

Under open input conditions, the /IN will be biased at a  $V_{CC}/2$  voltage level and the IN input will be pulled to ground. This condition will force the Q output low to provide added stability.

The SY89321L is compatible with positive ECL 100k logic levels.

- Note 1.** Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- Note 2.** The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
- Note 3.** Due to the limited drive capability use for input of the same package only.
- Note 4.** Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential (GND) on the PCB.
- Note 5.** Max. limit only applicable for short durations, not for continuous operation!

- Note 9.** Cycle-to-cycle jitter definition: The variation of periods between adjacent cycles,  $T_n - T_{n-1}$ , where T is the time between rising edges of the output signal.
- Note 10.** Total jitter definition: with an ideal clock input of frequency  $\leq f_{MAX}$ , no more than one output edge in  $10^{12}$  output edge will deviate by more than the specified peak-to-peak jitter value.
