Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Features

- **Frequency Range 2.4 GHz to 2.5 GHz**
- **Supply Voltage 2.7 V to 3.6 V**
- **21 dBm Linear Output Power for IEEE 802.11b Mode**
- **3.5% EVM at 15.5 dBm Output Power for IEEE 802.11g Mode**
- **On-chip Power Detector with 20 dB Dynamic Range**
- **Power-down Mode and Biasing Control**
- **No External Components for Input Matching**
- **Low Profile Plastic Package QFN16 (4 $\times$ 4 $\times$ 0.9 mm)**

Benefits

- **IEEE 802.11b WLAN**
- **IEEE 802.11g OFDM WLAN**
- **PC Cards, PCMCIA**
- **2.4 GHz ISM Band Application**

Electrostatic sensitive device.

2.4-GHz SiGe Power Amplifier for 802.11b/g WLAN Systems

T7031

Preliminary

Description

Circuitry

The PA's is designed for low current-consumption 802.11b and 802.11g multi-mode applications such as Mini-PCI and PCMCIA for portable devices. The low profile plastic package with internal input matching to 50 Ω minimizes the PCB board-space and allows simplified integration with very few passive components. The on-chip power-detector provides a voltage linear to the output power while the standby/bias control logic provides power saving and shutdown as well as a linear adjustment of output power. The PA is realized as a two stage PA with internal interstage-matching and an open-collector output structure.

Process

The power amplifier is designed in Atmel's Silicon-Germanium (SiGe) process and provides excellent linearity and noise performance, high gain as well as good power-added efficiency.

Pin Description

Pin	Symbol	Function
1	VCC	Supply voltage
2	GND	Ground
3	VCTRL	Power-up/biasing control voltage
4	INT_MATCH	Interstage matching (must not be connected)
5	V2_PA_Out	Power amplifier output and supply voltage for 2nd power amplifier stage
6	V2_PA_Out	Power amplifier output and supply voltage for 2nd power amplifier stage
7	V2_PA_Out	Power amplifier output and supply voltage for 2nd power amplifier stage
8	V2_PA_Out	Power amplifier output and supply voltage for 2nd power amplifier stage
9	INT_MATCH	Interstage matching (must not be connected)
10	V_DET_OUT	Power detector output
11	GND	Ground
12	NC	Not connected
13	IN_MATCH	Input matching (must not be connected)
14	PA_IN	Power amplifier input

Absolute Maximum Ratings

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameters	Symbol	Value	Unit
Supply voltage, no RF voltage applied	V_{CC}	6	V
Supply current	I_{CC}	200	mA

Evaluation Board Layout

Figure 17. Layout of the Evaluation Board
Evaluation Board Set-up Institutions

After connection of all cables (RF and DC):

- V_{CC}, V_1, V_2 = 3.3 V
- Increase V_{CTRL} until 75 mA quiescent current is reached
  (V_{CTRL} ~ 1.55 V, at frequency = 2450 MHz, P_{IN} = -40 dBm)
- Unmodulated measurements:
  - Measure gain, P_{OUT}, PAE, currents, V_{DET} versus P_{IN}, V_{CTRL}, V_{CC}, frequency
- Modulated measurements: increase input power until desired linear output power is reached; this means in case of
  - 11 Mbps CCK Modulation →APCR measurement: P_{OUT} ~ 21 dBm
  - 54 Mbps OFDM Modulation →measurement of EVM
    (Error Vector Magnitude): P_{OUT} ~ 15.5 dBm
