

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## 4-Pin Reset Monitors

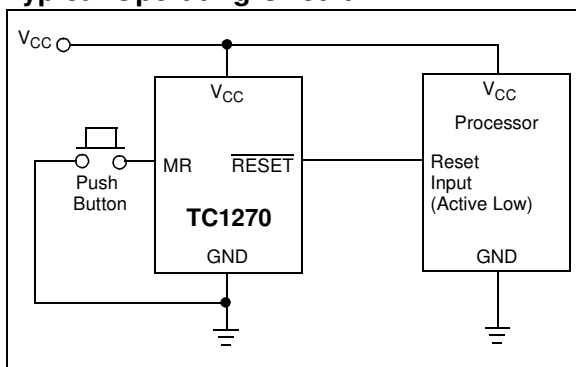

### Features:

- Precision  $V_{CC}$  Monitor for 1.8V, 2.7V, 3.0V, 3.3V and 5.0V Nominal Supplies
- Manual Reset Input
- 140 ms Minimum  $\overline{\text{RESET}}$ , Reset Output Duration
- $\overline{\text{RESET}}$  Output Valid to  $V_{CC} = 1.0\text{V}$  (TC1270)
- Low 7  $\mu\text{A}$  Supply Current
- $V_{CC}$  Transient Immunity
- Small 4-Pin SOT-143 Package
- No External Components
- Replacement for MAX811/812 and Offers a Lower Threshold Voltage Option

### Applications:

- Computers
- Embedded Systems
- Battery Powered Equipment
- Critical  $\mu\text{P}$  Power Supply Monitoring

### Typical Operating Circuit

### General Description

The TC1270 and TC1271 are cost-effective system supervisor circuits designed to monitor  $V_{CC}$  in digital systems and provide a reset signal to the host processor when necessary. A manual reset input is provided to override the reset monitor, and is suitable for use as a push button reset. No external components are required.

The reset output is driven active within 20  $\mu\text{s}$  (4  $\mu\text{s}$  for F version) of  $V_{CC}$  falling through the reset voltage threshold. Reset is maintained active for a minimum of 140 ms after  $V_{CC}$  rises above the reset threshold. The TC1271 has an active-high  $\overline{\text{RESET}}$  output while the TC1270 has an active-low  $\overline{\text{RESET}}$  output. The output of the TC1270 is valid down to  $V_{CC} = 1\text{V}$ . Both devices are available in a 4-Pin SOT-143 package.

The TC1270/TC1271 devices are optimized to reject fast transient glitches on the  $V_{CC}$  line. Low supply current of 7  $\mu\text{A}$  ( $V_{CC} = 3.3\text{V}$ ) makes these devices suitable for battery powered applications.

### Package Type

# TC1270/TC1271

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings†

Supply Voltage ( $V_{CC}$ to GND) .....	+6.0V
$\overline{\text{RESET}}$ , Reset .....	-0.3V to ( $V_{CC} + 0.3V$ )
Input Current, $V_{CC}$ .....	20 mA
Output Current, $\overline{\text{RESET}}$ , Reset.....	20 mA
Operating Temperature Range.....	-40°C to +85°C
Storage Temperature Range .....	-65°C to +150°C

† Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

### ELECTRICAL SPECIFICATIONS

Electrical Characteristics: $V_{CC} = 5V$ for L/M versions, $V_{CC} = 3.3V$ for T/S versions, $V_{CC} = 3V$ for R version, $V_{CC} = 2.0V$ for F version. Unless otherwise noted, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ . Typical values are at $T_A = +25^\circ\text{C}$ . (Note 1).

## 2.0 TYPICAL CHARACTERISTICS

**Note:** The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

Pin No.	Symbol	Description
1	GND	Ground
2	$\overline{\text{RESET}}$ (TC1270)	$\overline{\text{RESET}}$ output remains low while $V_{CC}$ is below the Reset voltage threshold, and for at least 140 ms min. after $V_{CC}$ rises above Reset threshold
2	RESET (TC1271)	Reset output remains high while $V_{CC}$ is below the Reset voltage threshold, and for at least 140 ms min. after $V_{CC}$ rises above Reset threshold
3	$\overline{\text{MR}}$	Manual Reset input generates a Reset when $\overline{\text{MR}}$ is below $V_{IL}$
4	$V_{CC}$	Supply voltage

### 3.1 Ground Terminal (GND)

GND provides the negative reference for the analog input voltage. Typically, the circuit ground is used.

### 3.2 Reset Output ( $\overline{\text{RESET}}$ ) (TC1270)

$\overline{\text{RESET}}$  output remains low while  $V_{CC}$  is below the Reset voltage threshold ( $V_{TRIP}$ ). Once the device voltage ( $V_{CC}$ ) returns to a high level ( $V_{TRIP} + V_{HYS}$ ), the device will remain in Reset for the Reset delay timer ( $T_{RST}$ ). After that time expires, the  $\overline{\text{RESET}}$  pin will be driven to the high state.

### 3.3 Reset Output (RESET) (TC1271)

RESET output remains high while  $V_{CC}$  is below the Reset voltage threshold ( $V_{TRIP}$ ). Once the device voltage ( $V_{CC}$ ) returns to a high level ( $V_{TRIP} + V_{HYS}$ ), the device will remain in Reset for the Reset delay timer ( $T_{RST}$ ). After that time expires, the RESET pin will be driven to the low state.

### 3.4 Manual Reset ( $\overline{\text{MR}}$ )

The Manual Reset ( $\overline{\text{MR}}$ ) input pin allows a push button switch to easily be connected to the system. When the push button is depressed, it forces a system Reset. This pin has circuitry that filters noise that may be present on the MR signal.

The  $\overline{\text{MR}}$  pin is active-low and has an internal pull-up resistor.

### 3.5 Supply Voltage ( $V_{CC}$ )

$V_{CC}$  can be used for power supply monitoring or a voltage level that requires monitoring.

# TC1270/TC1271

## 4.0 APPLICATIONS INFORMATION

### 4.1 $V_{CC}$ Transient Rejection

The TC1270/TC1271 provides accurate  $V_{CC}$  monitoring and Reset timing during power-up, power-down, and brownout/sag conditions, and rejects negative-going transients (glitches) on the power supply line. Figure 4-3 shows the maximum transient duration vs. maximum negative excursion (overdrive) for glitch rejection. Any combination of duration and overdrive that lays **under** the curve will **not** generate a Reset signal. Combinations above the curve are detected as a brown-out or power-down. Transient immunity can be improved by adding a capacitor in close proximity to the  $V_{CC}$  pin of the TC1270/TC1271.

**FIGURE 4-1:** Maximum Transient Duration vs. Overdrive for Glitch Rejection at +25°C.

### 4.2 Reset Signal Integrity During Power-Down

The TC1270  $\overline{\text{RESET}}$  output is valid to  $V_{CC} = 1.0V$ . Below this voltage the output becomes an "open circuit" and does not sink current. This means CMOS logic inputs to the microprocessor will be floating at an undetermined voltage. Most digital systems are completely shut down well above this voltage. However, in situations where  $\overline{\text{RESET}}$  must be maintained valid to  $V_{CC} = 0V$ , a pull-down resistor must

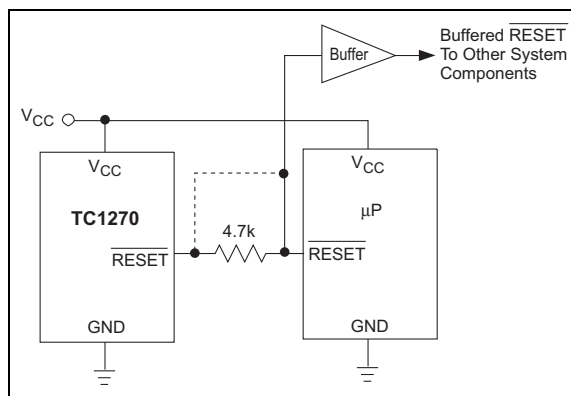

be connected from  $\overline{\text{RESET}}$  to ground to discharge stray capacitances and hold the output low (Figure 4-2). This resistor value, though not critical, should be chosen such that it does not appreciably load  $\overline{\text{RESET}}$  under normal operation (100 k $\Omega$  will be suitable for most applications). Similarly, a pull-up resistor to  $V_{CC}$  is required for the TC1271 to ensure a valid high  $\overline{\text{RESET}}$  for  $V_{CC}$  below 1.1V.

**FIGURE 4-2:** Ensuring  $\overline{\text{RESET}}$  Valid to  $V_{CC} = 0V$ .

### 4.3 Processors With Bidirectional I/O Pins

Some microprocessors (such as Motorola's 68HC11) have bidirectional Reset pins. Depending on the current drive capability of the processor pin, an indeterminate logic level may result if there is a logic conflict. This can be avoided by adding a 4.7 k $\Omega$  resistor in series with the output of the TC1270/TC1271 (Figure 4-3). If there are other components in the system which require a Reset signal, they should be buffered so as not to load the Reset line. If the other components are required to follow the Reset I/O of the microprocessor, the buffer should be connected as shown with the solid line.

**FIGURE 4-3:** Interfacing to Bidirectional Reset I/O.

- Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.25 mm per side.
- Dimensioning and tolerancing per ASME Y14.5M.
  - BSC: Basic Dimension. Theoretically exact value shown without tolerances.
  - REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-031B

## APPENDIX A: REVISION HISTORY

### Revision D (February 2007)

- **Section 5.0 “Packaging Information”:**  
Corrected SOT-143 Packaging Information.
- **Section 3.0 “Pin Descriptions”:** Added pin descriptions.
- Added disclaimer on package outline drawing.
- Updated package outline drawing.
- **Section 1.0 “Electrical Characteristics”:** Reformatted table.

### Revision C (June 2006)

- Enhanced SOT-143 Packaging Information.

### Revision B (May 2002)

- Undocumented changes.

### Revision A (March 2002)

- Original Release of this Document.

# TC1270/TC1271

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
