TOSHIBA MOS DIGITAL INTEGRATED CIRCUIT SILICON GATE CMOS

2 GBIT (256M × 8 BIT) CMOS NAND E²PROM**DESCRIPTION**

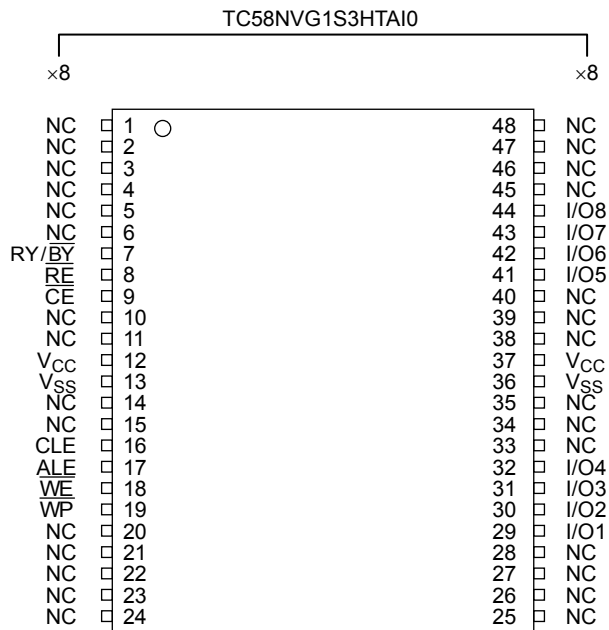

The TC58NVG1S3HTAI0 is a single 3.3V 2 Gbit (2,281,701,376 bits) NAND Electrically Erasable and Programmable Read-Only Memory (NAND E²PROM) organized as (2048 + 128) bytes × 64 pages × 2048 blocks. The device has two 2176-byte static registers which allow program and read data to be transferred between the register and the memory cell array in 2176-byte increments. The Erase operation is implemented in a single block unit (128 Kbytes + 8 Kbytes: 2176 bytes × 64 pages).

The TC58NVG1S3HTAI0 is a serial-type memory device which utilizes the I/O pins for both address and data input/output as well as for command inputs. The Erase and Program operations are automatically executed making the device most suitable for applications such as solid-state file storage, voice recording, image file memory for still cameras and other systems which require high-density non-volatile memory data storage.

Data Output

When t_{REH} is long, output buffers are disabled by $\overline{RE}=\text{High}$, and the hold time of data output depend on t_{RHOH} (25ns MIN). On this condition, waveforms look like normal serial read mode.

When t_{REH} is short, output buffers are not disabled by $\overline{RE}=\text{High}$, and the hold time of data output depend on t_{RLOH} (5ns MIN). On this condition, output buffers are disabled by the rising edge of \overline{CLE} , \overline{ALE} , \overline{CE} or falling edge of \overline{WE} , and waveforms look like Extended Data Output Mode.

(*1) t_{PROG} : Since the last page programming by 10h command is initiated after the previous cache program, the t_{PROG} during cache programming is given by the following equation.

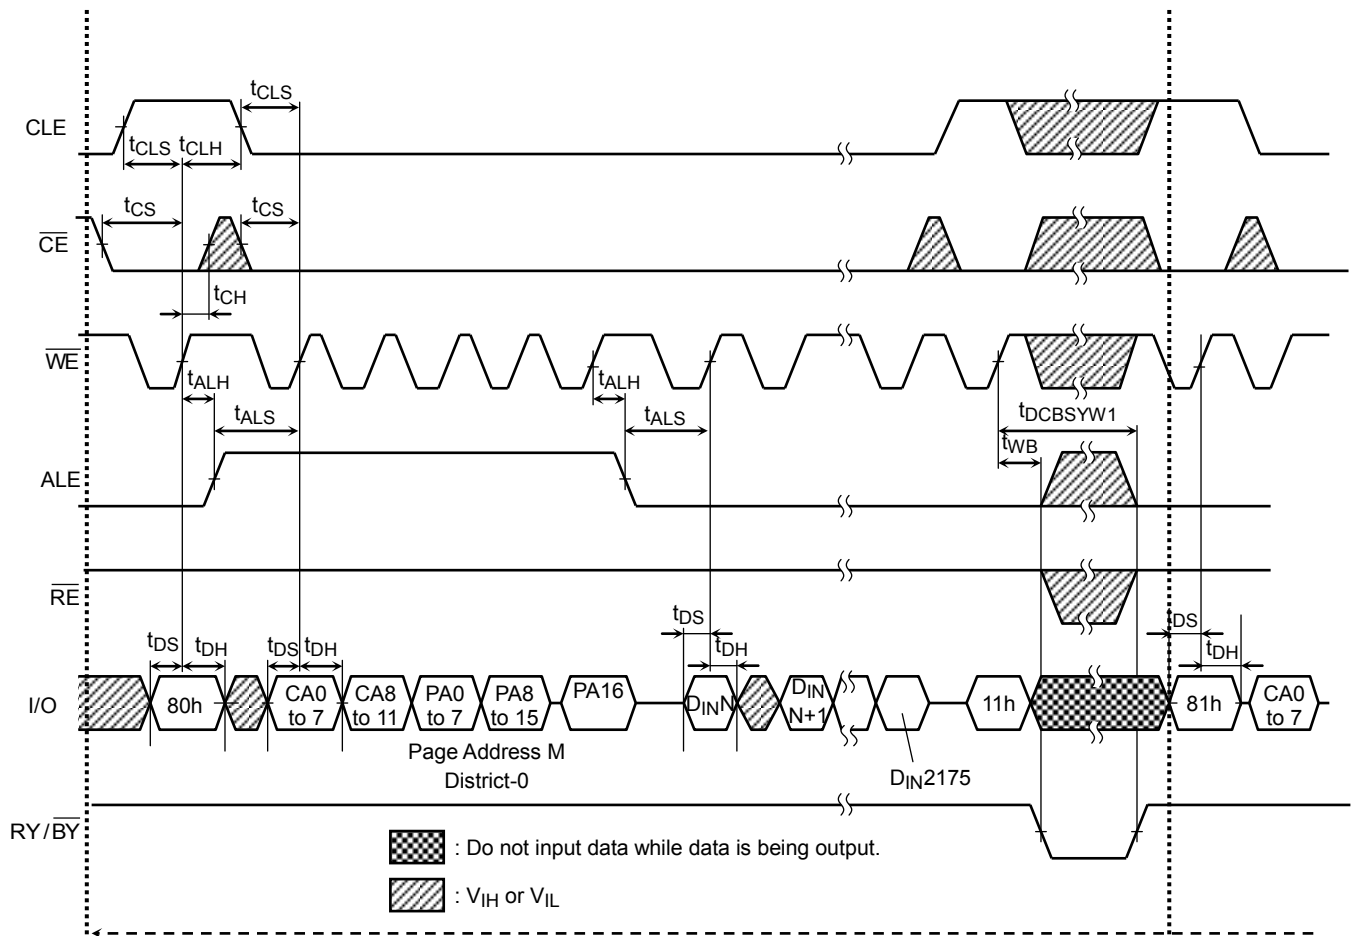

$$t_{PROG} = t_{PROG} \text{ of the last page} + t_{PROG} \text{ of the previous page} - A$$

$$A = (\text{command input cycle} + \text{address input cycle} + \text{data input cycle time of the last page})$$

If "A" exceeds the t_{PROG} of previous page, t_{PROG} of the last page is $t_{PROG} \text{ max}$.

(Note) Make sure to terminate the operation with 80h-10h- command sequence.
 If the operation is terminated by 80h-15h command sequence, monitor I/O 6 (Ready / Busy) by issuing Status Read command (70h) and make sure the previous page program operation is completed. If the page program operation is completed issue FFh reset before next operation.
