TOSHIBA MOS DIGITAL INTEGRATED CIRCUIT SILICON GATE CMOS

**4 GBIT (512M × 8 BIT) CMOS NAND E<sup>2</sup>PROM****DESCRIPTION**

The TC58NYG2S0HBAI6 is a single 1.8V 4 Gbit (4,563,402,752 bits) NAND Electrically Erasable and Programmable Read-Only Memory (NAND E<sup>2</sup>PROM) organized as (4096 + 256) bytes × 64 pages × 2048 blocks. The device has two 4352-byte static registers which allow program and read data to be transferred between the register and the memory cell array in 4352-byte increments. The Erase operation is implemented in a single block unit (256 Kbytes + 16 Kbytes: 4352 bytes × 64 pages).

The TC58NYG2S0HBAI6 is a serial-type memory device which utilizes the I/O pins for both address and data input/output as well as for command inputs. The Erase and Program operations are automatically executed making the device most suitable for applications such as solid-state file storage, voice recording, image file memory for still cameras and other systems which require high-density non-volatile memory data storage.

**Data Output**

When t<sub>REH</sub> is long, output buffers are disabled by /RE=High, and the hold time of data output depend on t<sub>RHOH</sub> (25ns MIN). On this condition, waveforms look like normal serial read mode.

When t<sub>REH</sub> is short, output buffers are not disabled by /RE=High, and the hold time of data output depend on t<sub>RLOH</sub> (5ns MIN). On this condition, output buffers are disabled by the rising edge of CLE,ALE,/CE or falling edge of /WE, and waveforms look like Extended Data Output Mode.

(\*1)  $t_{PROG}$ : Since the last page programming by 10h command is initiated after the previous cache program, the  $t_{PROG}$  during cache programming is given by the following equation.

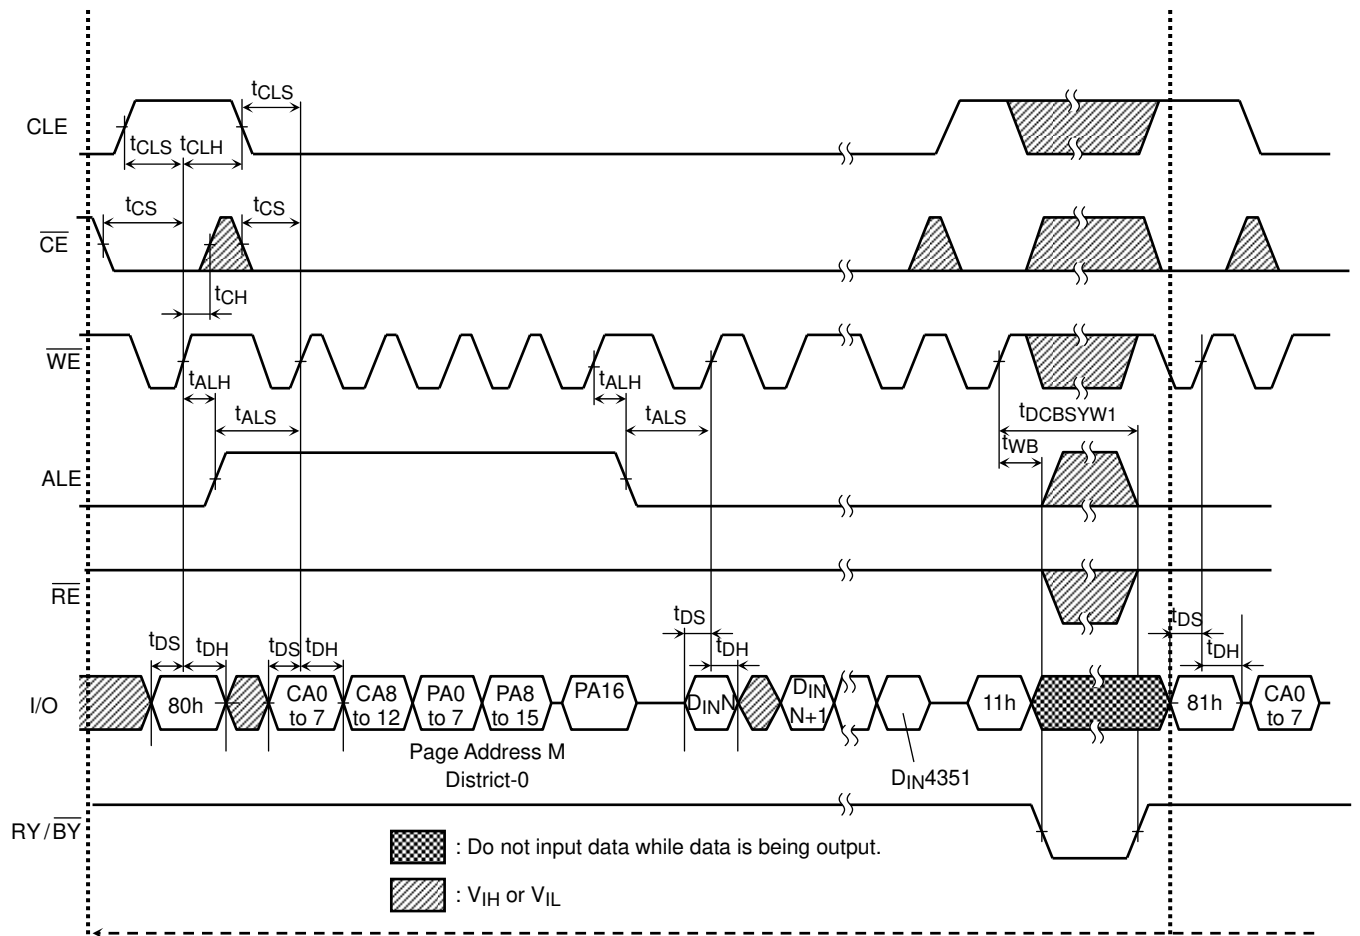

$$t_{PROG} = t_{PROG} \text{ of the last page} + t_{PROG} \text{ of the previous page} - A$$

$$A = (\text{command input cycle} + \text{address input cycle} + \text{data input cycle time of the last page})$$

If "A" exceeds the  $t_{PROG}$  of previous page,  $t_{PROG}$  of the last page is  $t_{PROG} \text{ max}$ .
