

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# 3 BAND EQUALIZER AUDIO PROCESSOR WITH SUBWOOFER CONTR

## 1 FEATURES

- 3 STEREO INPUTS
- AUXILIARY MONO INPUT
- INPUT ATTENUATION CONTROL IN 0.5dB STEP
- TREBLE MIDDLE AND BASS CONTROL
  - FOUR SPEAKERS ATTENUATORS:
  - 4 INDEPENDENT SPEAKERS CONTROL IN 1dB STEPS FOR BALANCE FACILITY
  - INDEPENDENT MUTE FUNCTION
- SUBWOOFER OUTPUT (L+R) CONTROLLED IN 1dB STEP INPUTS
- ALL FUNCTIONS PROGRAMMABLE VIA SERIAL BUS

## 2 DESCRIPTION

The TDA7429L is volume tone (bass middle and treble) balance (Left/Right) processors for quality audio

**Figure 1. Package**

**Table 1. Order Codes**

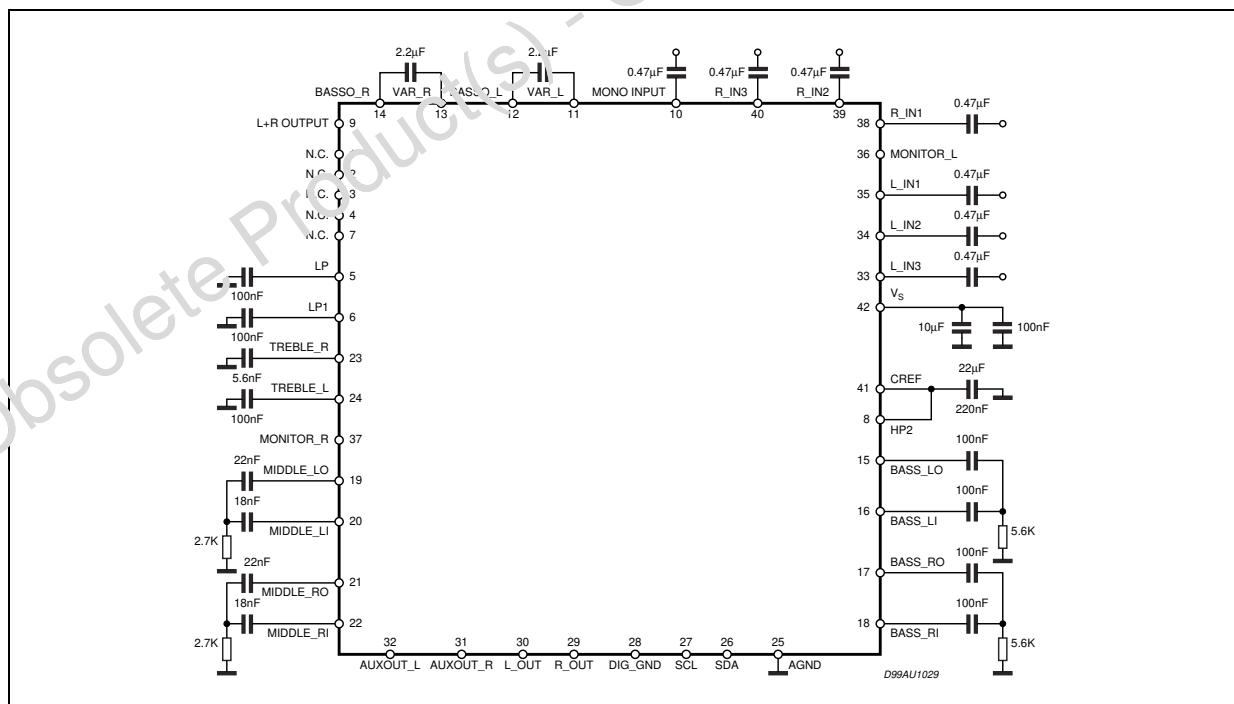

Part Number	Package
TDA7429L	SDIP42

applications in TV and Hi-Fi systems, providing also an additional subwoofer control.

The AC signal setting is obtained by resistor networks and switches combined with operational amplifiers.

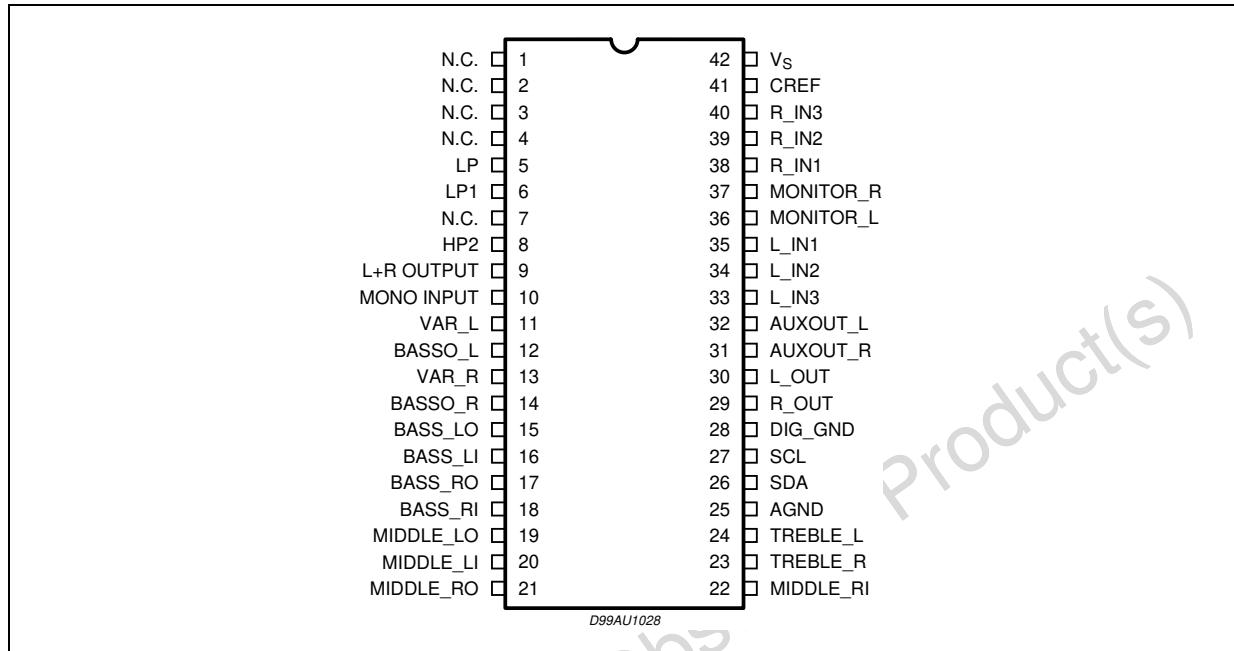

Thanks to the used BIPOLE/CMOS Technology, Low Distortion, Low Noise and DC stepping are obtained.

**Figure 2. Test Circuit**

**Table 2. Absolute Maximum Ratings**

Symbol	Parameter	Value	Unit
V <sub>S</sub>	Operating Supply Voltage	5.5	V
T <sub>amb</sub>	Operating Ambient Temperature	0 to 70	°C
T <sub>stg</sub>	Storage Temperature Range	-55 to 150	°C

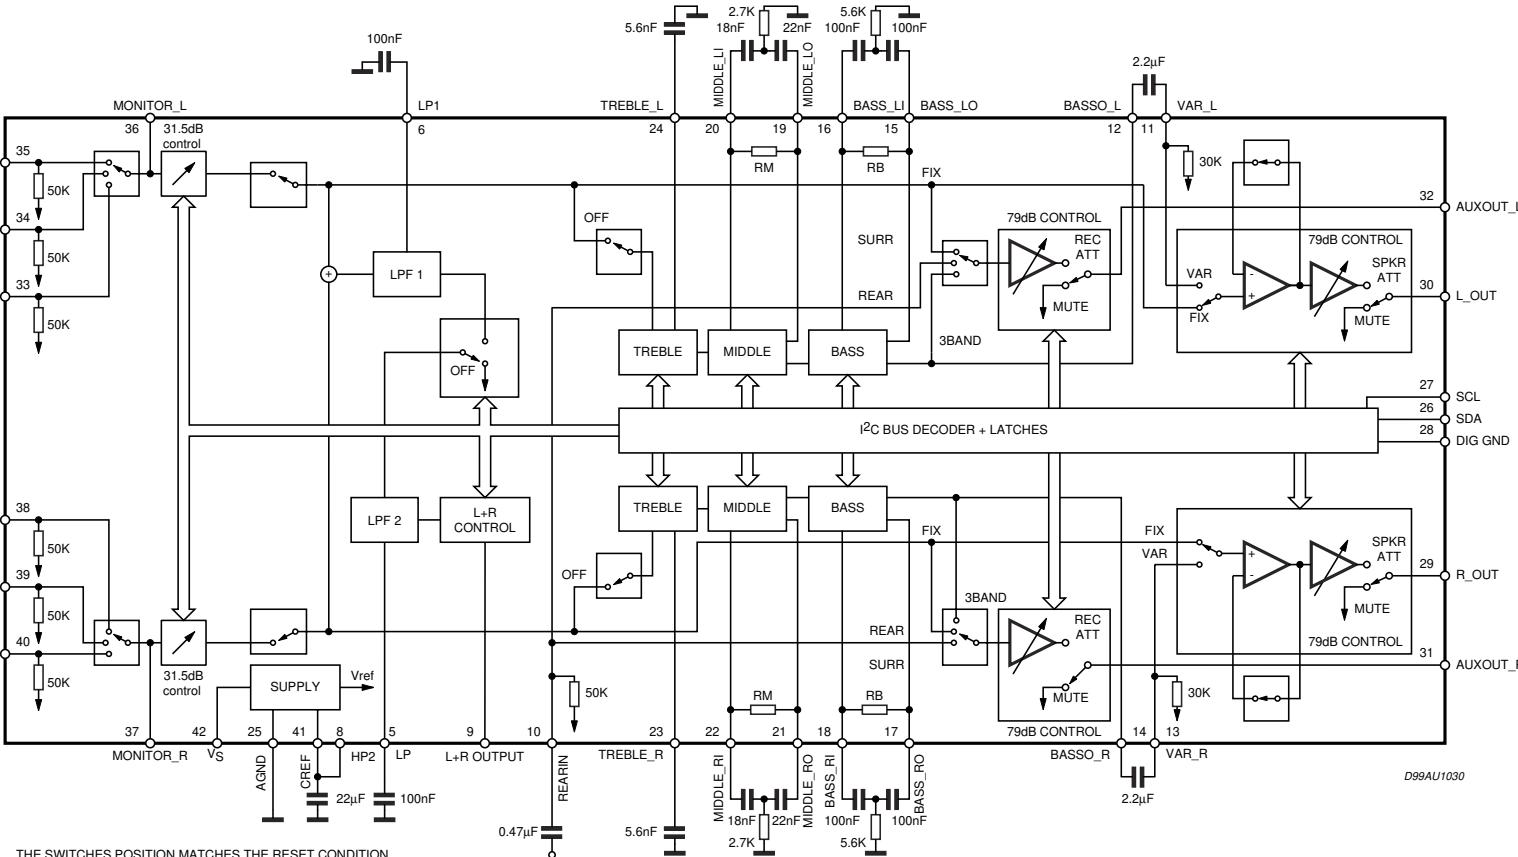

**Figure 3. Pin Description****Table 3. Quick Reference Data**

Symbol	Parameter	Min.	Typ.	Max.	Unit
V <sub>S</sub>	Supply Voltage	7	9	10.2	V

### 3 I<sup>2</sup>C BUS INTERFACE

Data transmission from microprocessor to the TDA7429L and viceversa takes place through the 2 wires I<sup>2</sup>C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

#### 3.1 Data Validity

As shown in fig. 5, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

#### 3.2 Start and Stop Conditions

As shown in fig.6 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

### 3.3 Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

### 3.4 Acknowledge

The master ( $\mu$ P) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 7). The peripheral (audioprocessor) that acknowledges has to pull-down (LOW) the SDA line during this clock pulse.

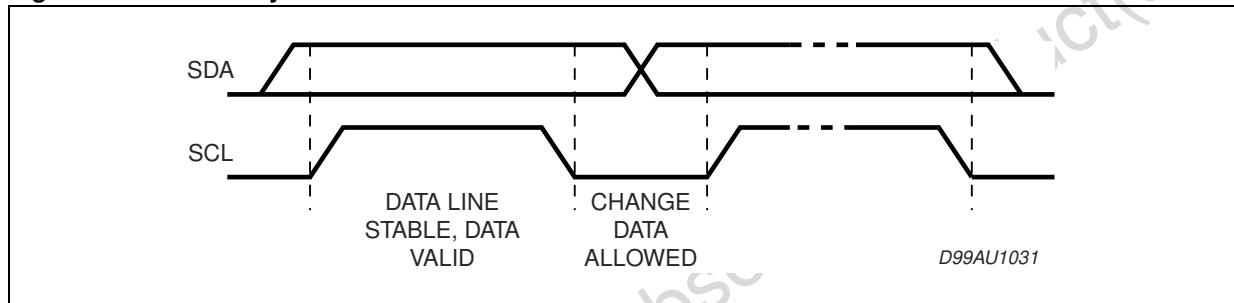

The audioprocessor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

### 3.5 Transmission without Acknowledge

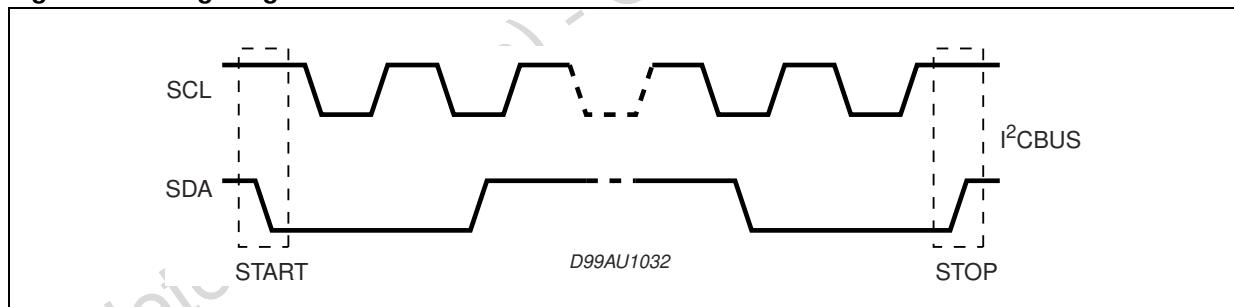

Avoiding to detect the acknowledge of the audioprocessor, the  $\mu$ P can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking.

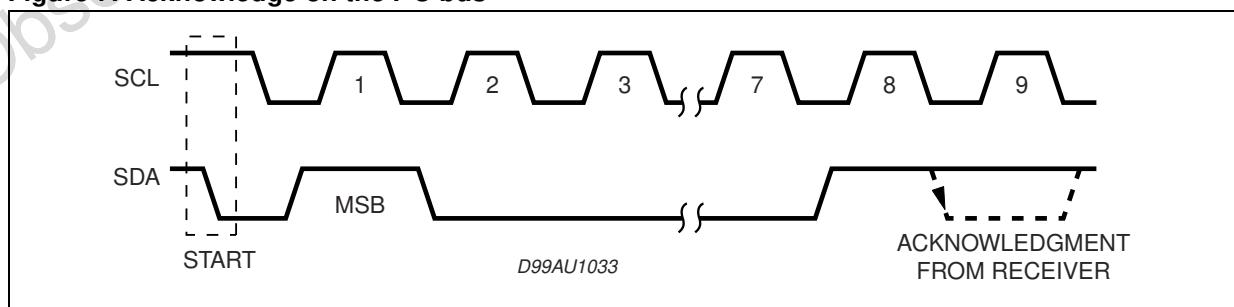

**Figure 5. Data validity on the I<sup>2</sup>C bus**

**Figure 6. Timing Diagram of I<sup>2</sup>C bus**

**Figure 7. Acknowledge on the I<sup>2</sup>C bus**

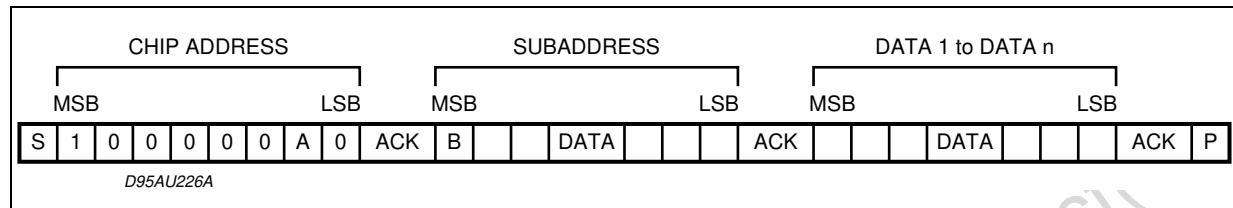

## 4 SOFTWARE SPECIFICATION

### 4.1 Interface Protocol

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7429L address
- A subaddress bytes
- A sequence of data (N byte + acknowledge)
- A stop condition (P)

**Figure 8.**

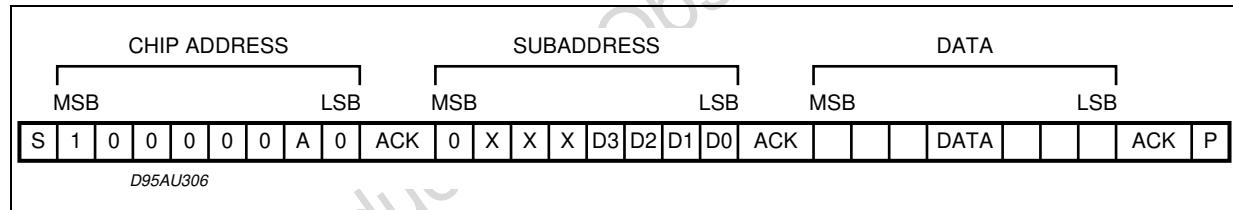

## 5 EXAMPLES

### 5.1 No Incremental Bus

The TDA7429L receives a start condition, the correct chip address, a subaddress with the MSB = 0 (no incremental bus), N-datas (all these datas concern the subaddress selected), a stop condition.

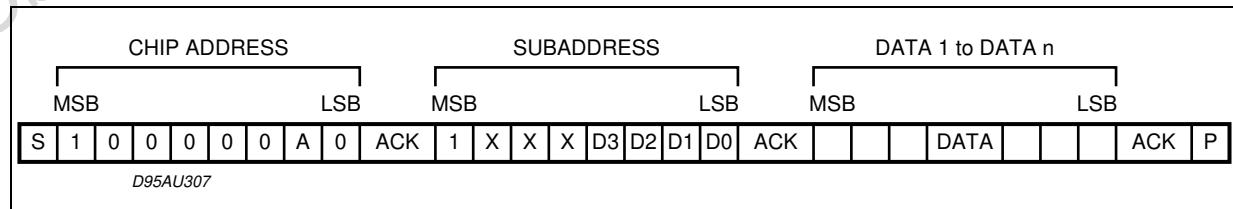

**Figure 9.**

### 5.2 Incremental Bus

The TDA7429L receives a start condition, the correct chip address, a subaddress with the MSB = 1 (incremental bus): now it is in a loop condition with an autoincrease of the subaddress whereas SUBADDRESS from "1XXX1010" to "1XXX1111" of DATA are ignored. The DATA 1 concern the subaddress sent, and the DATA 2 concern the subaddress sent plus one in the loop etc, and at the end it receives the stop condition.

**Figure 10.**

**Table 6. Function Selection**

The first byte (subaddress)

MSB	D7	D6	D5	D4	D3	D2	D1	LSB D0	SUBADDRESS
