

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

4 x 50 W power amplifier with full I²C diagnostics, high efficiency and low voltage operation

Datasheet - production data

Features

- Multipower BCD technology
- MOSFET output power stage
- DMOS power output
- Class SB high efficiency
- High output power capability 4x28 W/4 Ω @ 14.4 V, 1 kHz, 10% THD, 4 x 45 W max power
- Max power 4 x 72 W / 2 Ω
- Full I²C bus driving:
 - Standby
 - Independent front/rear soft play/mute
 - Selectable gain 26 dB /16 dB (for low noise line output function)
 - High efficiency enable/disable
 - I²C bus digital diagnostics (including DC bus AC load detection)
- Full fault protection
- DC offset detection
- Four independent short circuit protection
- Clipping detector pin with selectable threshold (2 %/10 %)
- Standby/mute pin
- Linear thermal shutdown with multiple thermal warning
- ESD protection

- Very robust against misconnections
- Improved SVR suppression during battery transients
- Capable to operate down to 6 V (e.g. “Start-stop”)

Description

The TDA7569BLV is the most advanced BCD technology quad bridge car radio amplifier of his family, including a wide range of innovative features.

The TDA7569BLV is equipped with the most complete diagnostics array that communicates the status of each speaker through the I²C bus.

The dissipated output power under average listening condition is significantly reduced when compared to the conventional class AB solutions, thanks to the patented solution. Moreover it has been designed to be very robust against several kinds of misconnections.

It is moreover compliant to the most recent OEM specifications for low voltage operation (so called 'start-stop' battery profile during engine stop and re-start), helping car manufacturers to reduce the overall emissions and thus contributing to environment protection.

Figure 1. Device summary

Order code	Package	Packing
TDA7569BLVSM	Flexiwatt27 (SMD)	Tube
TDA7569BLVSMTR		Tape and reel

3 Electrical specifications

3.1 Absolute maximum ratings

Table 2. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{op}	Operating supply voltage ⁽¹⁾	18	V
V_S	DC supply voltage	28	V
V_{peak}	Peak supply voltage (for $t_{max} = 50$ ms)	50	V
GNDmax	Ground pins voltage	-0.3 to 0.3	V
V_{CK}, V_{DATA}	CK and DATA pin voltage	-0.3 to 6	V
V_{cd}	Clip detector voltage	-0.3 to V_{op}	V
V_{stby}	STBY pin voltage	-0.3 to V_{op}	V
I_O	Output peak current (not repetitive $t_{max} = 100$ ms)	8	A
	Output peak current (repetitive $f > 10$ kHz)	6	
P_{tot}	Power dissipation $T_{case} = 70^\circ\text{C}$ ⁽²⁾	85	W
T_{stg}, T_j	Storage and junction temperature ⁽³⁾	-55 to 150	$^\circ\text{C}$
T_{amb}	Operative temperature range	-40 to 105	$^\circ\text{C}$

1. For $R_L = 2\ \Omega$ the output current limit is reached for $V_{OP} > 16$ V; at this supply level internal protections might be triggered.
2. This is maximum theoretical value; for power dissipation in real application conditions, please refer to curves reported in [Section 3.4: Electrical characteristics curves](#).
3. A suitable dissipation system should be used to keep T_j inside the specified limits.

3.2 Thermal data

Table 3. Thermal data

Symbol	Parameter	PowerSO	Flexiwatt	Unit
$R_{th\ j-case}$	Thermal resistance junction-to-case Max.	1	1	$^\circ\text{C}/\text{W}$

3.3 Electrical characteristics

Refer to the test circuit, $V_S = 14.4$ V; $R_L = 4\ \Omega$; $f = 1$ kHz; $G_V = 26$ dB; $T_{amb} = 25\ ^\circ\text{C}$; unless otherwise specified.

Tested at $T_{amb} = 25\ ^\circ\text{C}$ and $T_{hot} = 105\ ^\circ\text{C}$; functionality guaranteed for $T_j = -40\ ^\circ\text{C}$ to $150\ ^\circ\text{C}$.

4 Diagnostics functional description

4.1 Turn-on diagnostic

It is strongly recommended to activate this function at turn on (standby out) through I²C bus request. Detectable output faults are:

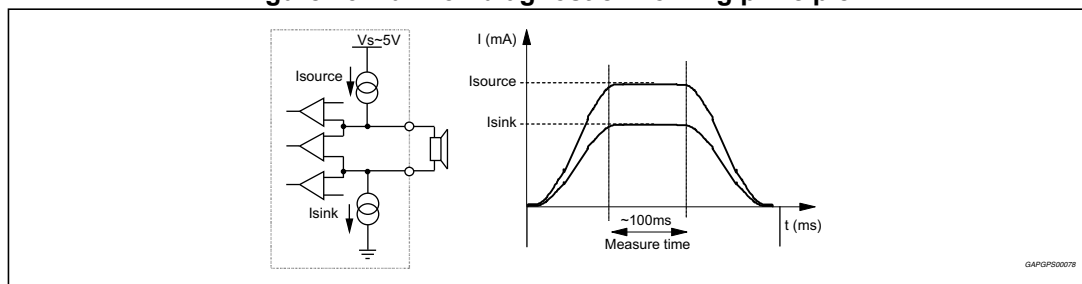

- SHORT TO GND
- SHORT TO V_s
- SHORT ACROSS THE SPEAKER
- OPEN SPEAKER

To verify if any of the above misconnections are in place, a subsonic (inaudible) current pulse ([Figure 23](#)) is internally generated, sent through the speaker(s) and sunk back. The Turn On diagnostic status is internally stored until a successive diagnostic pulse is requested (after a I²C reading).

If the "standby out" and "diag. enable" commands are both given through a single programming step, the pulse takes place first (during the pulse the power stage stays 'off', showing high impedance at the outputs).

Afterwards, when the Amplifier is biased, the PERMANENT diagnostic takes place. The previous Turn On state is kept until a short appears at the outputs.

Figure 23. Turn-on diagnostic: working principle

[Figure 24](#) and [25](#) show SVR and OUTPUT waveforms at the turn-on (stand-by out) with and without turn-on diagnostic.

Figure 24. SVR and output behavior (Case 1: without turn-on diagnostic)

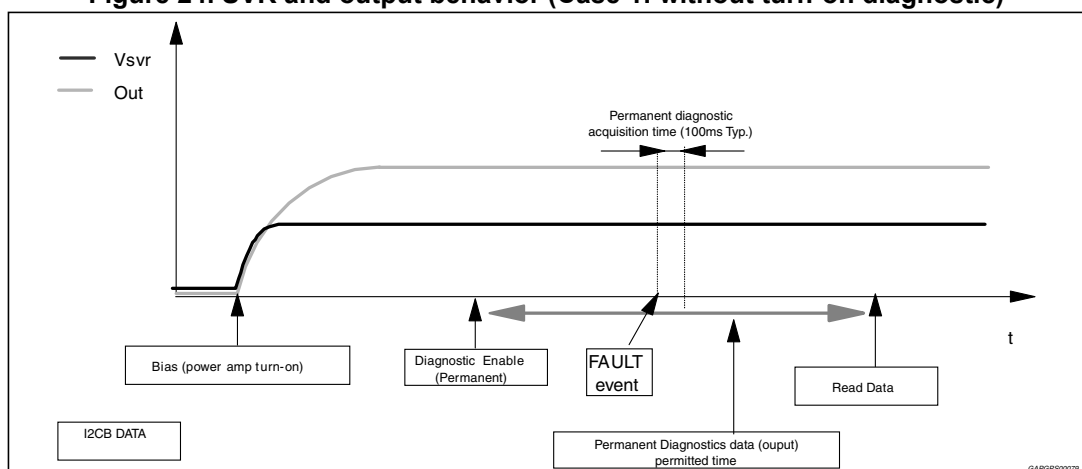

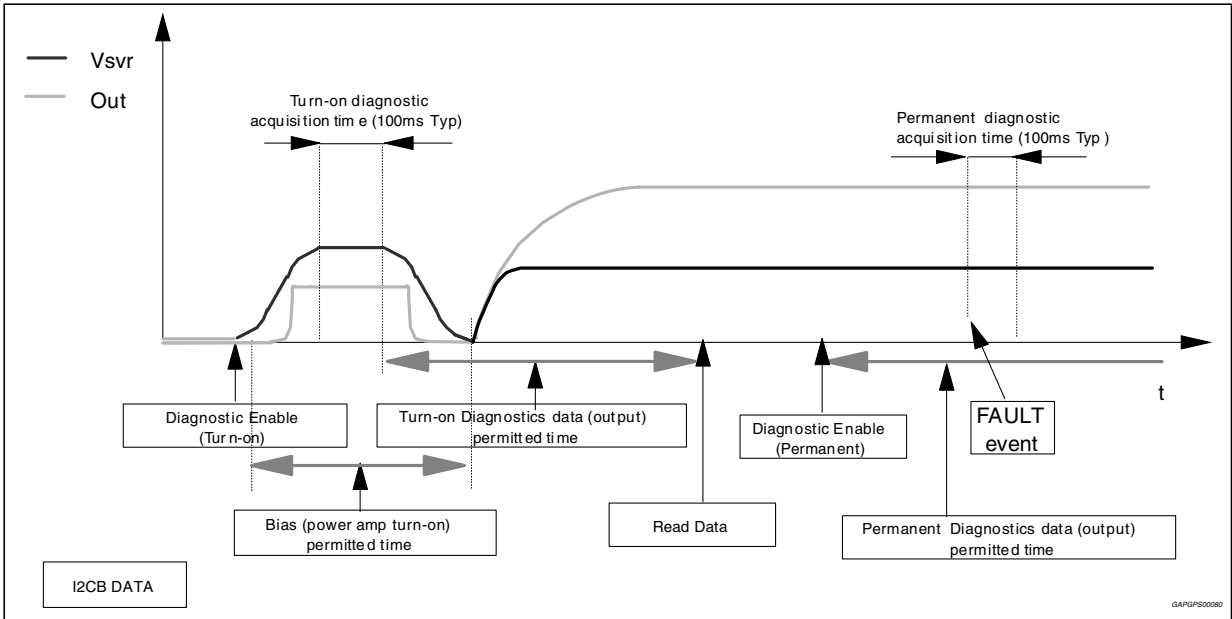

Figure 25. SVR and output pin behavior (Case 2: with turn-on diagnostic)

The information related to the outputs status is read and memorized at the end of the current pulse plateau. The acquisition time is 100 ms (typ.). No audible noise is generated in the process. As for SHORT TO GND / Vs the fault-detection thresholds remain unchanged from 26 dB to 16 dB gain setting. They are as follows:

Figure 26. Short circuit detection thresholds

Concerning SHORT ACROSS THE SPEAKER / OPEN SPEAKER, the threshold varies from 26 dB to 16 dB gain setting, since different loads are expected (either normal speaker's impedance or high impedance). The values in case of 26 dB gain are as follows:

Figure 27. Load detection thresholds - high gain setting

If the Line-Driver mode ($G_v = 16$ dB and Line Driver Mode diagnostic = 1) is selected, the same thresholds will change as follows:

Figure 28. Load detection threshold - low gain setting

4.2 Permanent diagnostics

Detectable conventional faults are:

- Short to GND
- Short to Vs
- Short across the speaker

The following additional feature is provided:

- Output offset detection

The TDA7569BLV has 2 operating status:

1. **RESTART mode.** The diagnostic is not enabled. Each audio channel operates independently of each other. If any of the a.m. faults occurs, only the channel(s) interested is shut down. A check of the output status is made every 1 ms (*Figure 29*). Restart takes place when the overload is removed.
2. **DIAGNOSTIC mode.** It is enabled via I²C bus and it self activates if an output overload (such as to cause the intervention of the short-circuit protection) occurs to the speakers outputs. Once activated, the diagnostics procedure develops as follows (*Figure 30*):
 - To avoid momentary re-circulation spikes from giving erroneous diagnostics, a check of the output status is made after 1ms: if normal situation (no overloads) is detected, the diagnostic is not performed and the channel returns active.
 - Instead, if an overload is detected during the check after 1 ms, then a diagnostic cycle having a duration of about 100 ms is started.
 - After a diagnostic cycle, the audio channel interested by the fault is switched to RESTART mode. The relevant data are stored inside the device and can be read by the microprocessor. When one cycle has terminated, the next one is activated by an I²C reading. This is to ensure continuous diagnostics throughout the car-radio operating time.
 - To check the status of the device a sampling system is needed. The timing is chosen at microprocessor level (over half a second is recommended).

Figure 29. Restart timing without diagnostic enable (permanent) - Each 1 mS time, a sampling of the fault is done

Figure 30. Restart timing with diagnostic enable (permanent)

4.3 Output DC offset detection

Any DC output offset exceeding ± 2 V is signalled out. This inconvenient might occur as a consequence of initially defective or aged and worn-out input capacitors feeding a DC component to the inputs, so putting the speakers at risk of overheating.

This diagnostic has to be performed with low-level output AC signal (or $V_{in} = 0$).

The test is run with selectable time duration by microprocessor (from a "start" to a "stop" command):

- START = Last reading operation or setting IB1 - D5 - (OFFSET enable) to 1
- STOP = Actual reading operation

Excess offset it is signalled out if persistent for all the assigned testing time. This feature is disabled if any overloads leading to activation of the short-circuit protection occurs in the process.

4.4 AC diagnostic

This function is design to detect accidental disconnection of tweeters in 2-way speaker and, more in general, presence of capacitive (AC) coupled loads.

This diagnostic is based on the notion that the overall speaker's impedance (woofer + parallel tweeter) will tend to increase towards high frequencies if the tweeter gets disconnected, because the remaining speaker (woofer) would be out of its operating range (high impedance). The diagnostic decision is made according to peak output current thresholds, and it is enabled by setting (IB2-D2) = 1. Two different detection levels are available:

- High current threshold IB2 (D7) = 0
 - lout > 500 mApk = normal status
 - lout < 250 mApk = open tweeter
- Low current threshold IB2 (D7) = 1
 - lout > 250 mApk = normal status
 - lout < 125 mApk = open tweeter

To correctly implement this feature, it is necessary to briefly provide a signal tone (with the amplifier in "play") whose frequency and magnitude are such as to determine an output current higher than 500 mApk with IB2(D7) = 0 (higher than 250 mApk with IB2(D7) = 1) in normal conditions and lower than 250 mApk with IB2(D7) = 0 (lower than 125 mApk with IB2(D7)=1) should the parallel tweeter be missing.

The test has to last for a minimum number of 3 sine cycles starting from the activation of the AC diagnostic function IB2<D2>) up to the I²C reading of the results (measuring period). To confirm presence of tweeter, it is necessary to find at least 3 current pulses over the above threshold over all the measuring period, else an "open tweeter" message will be issued.

The frequency / magnitude setting of the test tone depends on the impedance characteristics of each specific speaker being used, with or without the tweeter connected (to be calculated case by case). High-frequency tones (> 10 kHz) or even ultrasonic signals are recommended for their negligible acoustic impact and also to maximize the impedance module's ratio between with tweeter-on and tweeter-off.

Figure 31 and *32* shows the load impedance as a function of the peak output voltage and the relevant diagnostic fields.

It is recommended to keep output voltage always below 8 V (high threshold) or 4 V (low threshold) to avoid the circuit to saturate (causing wrong detection cases).

This feature is disabled if any overloads leading to activation of the short-circuit protection occurs in the process.

Figure 32. Current detection low: load impedance $|Z|$ vs. output peak voltage

5 Multiple faults

When more misconnections are applied simultaneously at the audio outputs, it is guaranteed that at least one of them is initially read out. The others are notified after successive cycles of I²C reading and faults removal, provided that the diagnostic is enabled. This is true for both kinds of diagnostic (Turn on and Permanent).

The table below shows all the couples of double-fault possible. It should be taken into account that a short circuit with the 4 ohm speaker unconnected is considered as double fault.

Table 5. Double fault table for turn-on diagnostic

	S. GND	S. Vs	S. Across L.	Open L.
S. GND	S. GND	S. Vs + S. GND	S. GND	S. GND
S. Vs	/	S. Vs	S. Vs	S. Vs
S. Across L.	/	/	S. Across L.	N.A.
Open L.	/	/	/	Open L. (*)

In Permanent Diagnostic the table is the same, with only a difference concerning Open Load (*), which is not among the recognizable faults. Should an Open Load be present during the device's normal working, it would be detected at a subsequent Turn on Diagnostic cycle (i.e. at the successive Car Radio Turn on).

5.1 Faults availability

All the results coming from I²C bus, by read operations, are the consequence of measurements inside a defined period of time. If the fault is stable throughout the whole period, it will be sent out.

To guarantee always resident functions, every kind of diagnostic cycles (Turn on, Permanent, Offset) will be reactivate after any I²C reading operation. So, when the micro reads the I²C, a new cycle will be able to start, but the read data will come from the previous diag. cycle (i.e. The device is in Turn On state, with a short to Gnd, then the short is removed and micro reads I²C. The short to Gnd is still present in bytes, because it is the result of the previous cycle. If another I²C reading operation occurs, the bytes do not show the short). In general to observe a change in Diagnostic bytes, two I²C reading operations are necessary.

6 Thermal protection

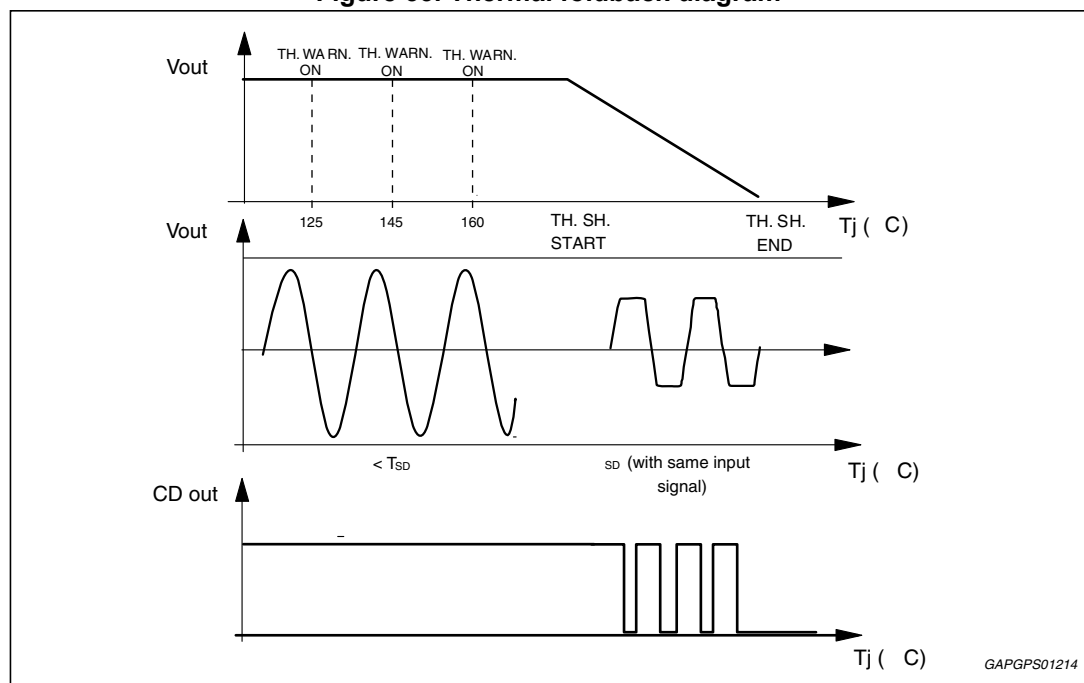

Thermal protection is implemented through thermal foldback (*Figure 33*).

Thermal foldback begins limiting the audio input to the amplifier stage as the junction temperatures rise above the normal operating range. This effectively limits the output power capability of the device thus reducing the temperature to acceptable levels without totally interrupting the operation of the device.

The output power will decrease to the point at which thermal equilibrium is reached. Thermal equilibrium will be reached when the reduction in output power reduces the dissipated power such that the die temperature falls below the thermal foldback threshold. Should the device cool, the audio level will increase until a new thermal equilibrium is reached or the amplifier reaches full power. Thermal foldback will reduce the audio output level in a linear manner.

Three thermal warning are available through the I²C bus data. After thermal shut down threshold is reached, the CD could toggle (as shown in *Figure 33*) or stay low, depending on signal level.

Figure 33. Thermal foldback diagram

6.1 Fast muting

The muting time can be shortened to less than 1.5ms by setting (IB2) D5 = 1. This option can be useful in transient battery situations (i.e. during car engine cranking) to quickly turnoff the amplifier to avoid any audible effects caused by noise/transients being injected by preamp stages. The bit must be set back to "0" shortly after the mute transition.

7 Battery transitions management

7.1 Low voltage operation (“start stop”)

The most recent OEM specifications are requiring automatic stop of car engine at traffic light, in order to reduce emissions of polluting substances. The TDA7569BLV, thanks to its innovating design, allows a continuous operation when battery falls down to 6/7V during such conditions, without producing pop noise. The maximum system power will be reduced accordingly.

Worst case battery cranking curves are shown below, indicating the shape and durations of allowed battery transitions.

Figure 34. Worst case battery cranking curve sample 1

$V_1 = 12\text{ V}$; $V_2 = 6\text{ V}$; $V_3 = 7\text{ V}$; $V_4 = 8\text{ V}$

$t_1 = 2\text{ ms}$; $t_2 = 50\text{ ms}$; $t_3 = 5\text{ ms}$; $t_4 = 300\text{ ms}$; $t_5 = 10\text{ ms}$; $t_6 = 1\text{ s}$; $t_7 = 2\text{ ms}$

Figure 35. Worst case battery cranking curve sample 2

$V_1 = 12\text{ V}$; $V_2 = 6\text{ V}$; $V_3 = 7\text{ V}$

$t_1 = 2\text{ ms}$; $t_2 = 5\text{ ms}$; $t_3 = 15\text{ ms}$; $t_5 = 1\text{ s}$; $t_6 = 50\text{ ms}$

7.2 Advanced battery management

In addition to compatibility with low V_{batt} , the TDA7569BLV is able to sustain upwards fast battery transitions (like the one showed in [Figure 36](#)) without causing unwanted audible effect, thanks to the innovative circuit topology.

Figure 36. Upwards fast battery transitions diagram
