

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

3 band car audio processor

Features

- Input multiplexer
 - Multiple input configuration for different application
- Loudness
 - 2nd order frequency response
 - Programmable center frequency
 - 15 dB with 1 dB steps
 - Selectable high frequency boost
 - Selectable flat-mode
- Volume
 - +15 dB to -15 dB with 1 dB step resolution
 - Soft-step control with programmable blend times
- Bass
 - 2nd order frequency response
 - Center frequency programmable in 4 steps
 - Q programmable 1.0/1.25/1.5/2.0
 - DC gain programmable
 - -15 to 15 dB range with 1 dB resolution
- Middle
 - 2nd order frequency response
 - Center frequency programmable in 4 steps
 - Q programmable 0.5/0.75/1.0/1.25
 - -15 to 15dB range with 1dB resolution
- Treble
 - 2nd order frequency response
 - Center frequency programmable in 4 steps
 - -15 to 15dB range with 1dB resolution
- Speaker
 - 4 independent soft step speaker controls
 - 0dB to -79dB with 1dB steps
 - Direct mute
- Subwoofer
 - 2nd order low pass filter with programmable cut off frequency
 - 2 independent soft step level control,
- Mute functions

- Direct mute
- Digitally controlled SoftMute with 4 programmable mute-times
- Offset detection
 - Offset voltage detection circuit for on-board power amplifier failure diagnosis
- Level meter
 - Provide rectified level voltage of main source signal (before loudness)
- Rear seat selector
 - Full source selector for rear seat output
- Mixing selector

Description

The TDA7719 is a high performance signal processor specifically designed for car radio applications. The device includes a high performance audioprocessor with fully integrated audio filters and new Soft Step architecture. The digital control allows programming in a wide range of filter characteristics. By the use of BCMS-process and liner signal processing low distortion and low noise are obtained.

$I_{DISDCErr}$	DCErr discharge current		5			mA
V_{OutH}	DCErr high voltage		3.3			V
V_{OutL}	DCErr low voltage		100			mV
Level meter						
V_{out}	Output voltage range		0		3.3	V
V_{LEVEL}	Output level	$V_{in} = 1 V_{rms}$	1.6			V
		$V_{in} = AC\ grounded$	0			V
T_{DEL}	Analog output delay time		2			μs
General						
e_{NO}	Output noise	BW = 20 Hz to 20 kHz A-Weighted, all gain = 0 dB		12		μV
		BW = 20 Hz - 20 kHz A-Weighted, output muted		6		μV
S/N	Signal to noise ratio	all gain = 0 dB, A-weighted; $V_o = 2 V_{RMS}$		104		dB
D	Distortion	$V_{IN} = 1 V_{RMS}$; all stages 0dB		0.01		%
S_C	Channel separation left/right			90		dB

1. When DC offset detector is not used, the impedance of mono single-ended input is $50 k\Omega$ instead of $100 k\Omega$.

4 Description

4.1 Input configuration

4.1.1 Front and rear selector

The input stage (Main source and 2nd source) is configurable to adapt to different application. There are 7 different configurations which provide different input structure and different number of input sources as shown below.

- 4 x QD,
- 2 x QD + 3 x SE,
- 1 x QD + 5 x SE,
- 1 x QD + 3 x SE + 2 x MD,
- 3 x QD + 1 x FD,
- 3 x QD + 2 x SE,
- 1 x QD + 2 x SE + 1 x FD + 1 x MD,
- 1 x QD + 3 x SE + 1 x FD

Note: QD = Quasi-Differential, SE = Single-ended input, FD = Full Differential, MD = mono Differential

The configuration of the input stage is controlled by ‘Input Configuration’ bits in I²C control table (Byte0 Bit5~Bit7). The table below shows the configuration of input pins in different configurations.

Table 6. Input pin configuration

Pin	Pin name	Configuration bits (Byte0 Bit7~Bit5)															
		"000"		"001"		"010"		"011"		"100"		"101"		"110"			
		CFG0	CFG1	CFG2	CFG3	CFG4	CFG5	CFG6	CFG7								
1	QD1L_SE1L _MD3+	QD1L	IN0	SE1L	IN0	SE1L	IN0	SE1L	IN0	QD1L	IN0	QD1L	IN0	MD3+	IN7	SE1L	IN0
2	QD1R_SE1R _MD3-	QD1R		SE1R		SE1R		SE1R		QD1R		QD1R		MD3-		SE1R	
3	QD1G_SE2L	QD1G		SE2L	IN4	SE2L	IN4	SE2L	IN4	QD1G		QD1G		SE2L	IN4	SE2L	IN4
4	QD2G_SE2R	QD2G		SE2R		SE2R		SE2R		QD2G	IN1	QD2G		SE2R		SE2R	
5	QD2L_SE3L	QD2L	IN1	SE3L	IN1	SE3L	IN1	SE3L	IN1	QD2L	IN1	QD2L	IN1	SE3L	IN1	SE3L	IN1
6	QD2R_SE3R	QD2R		SE3R		SE3R		SE3R		QD2R		QD2R		SE3R		SE3R	
7	QD3L	QD3L		QD3L	IN2	QD3L	IN2	QD3L	IN2	QD3L	IN2	QD3L	IN2	QD3L	IN2	QD3L	IN2
8	QD3G	QD3G		QD3G		QD3G		QD3G		QD3G		QD3G		QD3G		QD3G	
9	QD3R	QD3R		QD3R		QD3R		QD3R		QD3R		QD3R		QD3R		QD3R	
10	QD4L_FD4+ _SE4L_Md1+	QD4L	IN3	QD4L	IN5	SE4L	IN5	MD1+	IN3	FD4L+	IN5	SE4L	IN5	FD4L+	IN3	FD4L+	IN3
11	QD4G_FD4L _SE4R_Md1-	QD4G		QD4G		SE4R		MD1-		FD4L-		SE4R		FD4L-		FD4L-	IN3
12	QD4G_FD4R_S E5L_Md2-	QD4G		QD4G	IN6	SE5L	IN6	MD2-	IN3	FD4R-	IN6	SE5L	IN6	FD4R-	IN3	FD4R-	IN3
13	QD4R_FD4R+ _SE5R_Md2+	QD4R		QD4R		SE5R		MD2+		FD4R+		SE5R		FD4R+		FD4R+	

With different input configuration, the input source can be selected with input selector (Byte0/1 Bit0~Bit2). The following matrix defines the selector configuration of different input sources dependant on the configuration bits.

Table 7. Selector configuration matrix

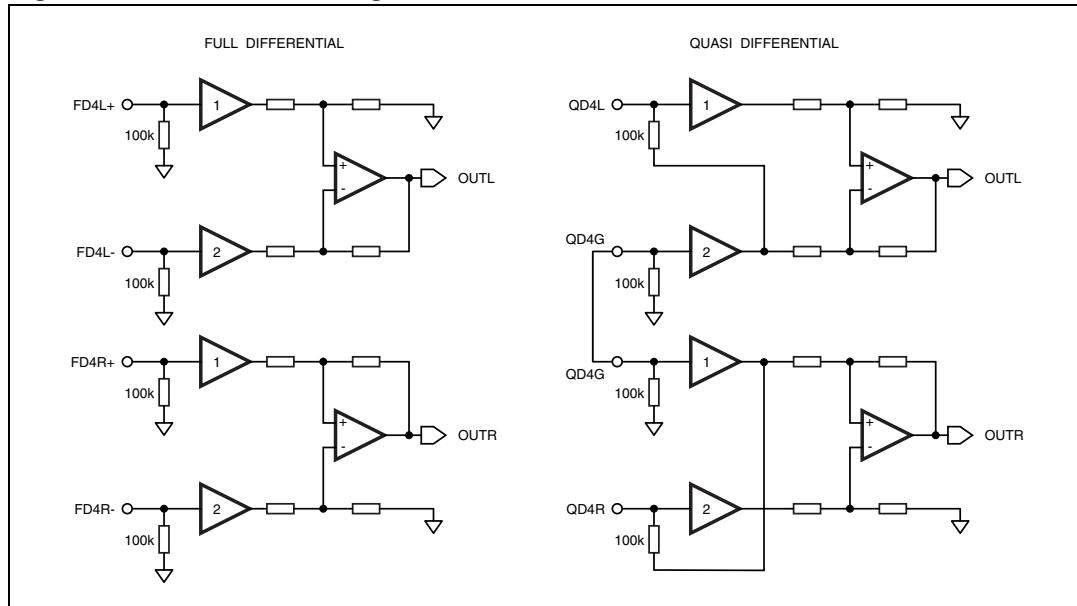

Selector Bits (Byte0/1 Bit2~Bit0)	000	001	010	011	100	101	110	111
	IN0	IN1	IN2	IN3	IN4	IN5	IN6	IN7
CFG0	QD1	QD2	QD3	QD4	NA	NA	NA	NA
CFG1	SE1	SE3	QD3	QD4	SE2	NA	NA	NA
CFG2	SE1	SE3	QD3	NA	SE2	SE4	SE5	NA
CFG3	SE1	SE3	QD3	MD1/2	SE2	NA	NA	NA
CFG4	QD1	QD2	QD3	FD	NA	NA	NA	NA
CFG5	QD1	QD2	QD3	NA	NA	SE4	SE5	NA
CFG6	NA	SE3	QD3	FD	SE2	NA	NA	MD3
CFG7	SE1	SE3	QD3	FD	SE2	NA	NA	NA

Note: In each configuration, only the light grey cells are allowed. The dark grey cells are not allowed.

MD1/MD2 selection is defined by extra bit – ‘MD1/2 selection’ in I²C control table (Bit3 of Byte0/1).

The input stage can be configured to 0dB or 3dB gain with I²C bus. The 0dB configuration allows up to 2Vrms input signal level, while with 3dB gain, the internal signal will start to clip when input signal level is higher than 1.414Vrms.

The Pin10~Pin13 can be configured as full differential input stage or quasi-differential input. When it is configured as quasi-differential input, both Pin11 and Pin12 are used as the QD common input pins. These two pins must be connected together externally in application. In this case the input impedance of QD4 common is reduced to 50kΩ (half of QD4 left and right input). The diagram below shows both QD and FD configuration of QD4/FD4.

Figure 3. QD and FD configuration of QD4/FD4

4.1.2 Direct path

The input pins can be configured as direct path mode by setting Byte1 Bit5~Bit7. In direct path mode the input pins are connected to dedicated mono fader directly, all the filters and volume are bypassed. Below is described the assignment of the input pins and output fader in direct path mode:

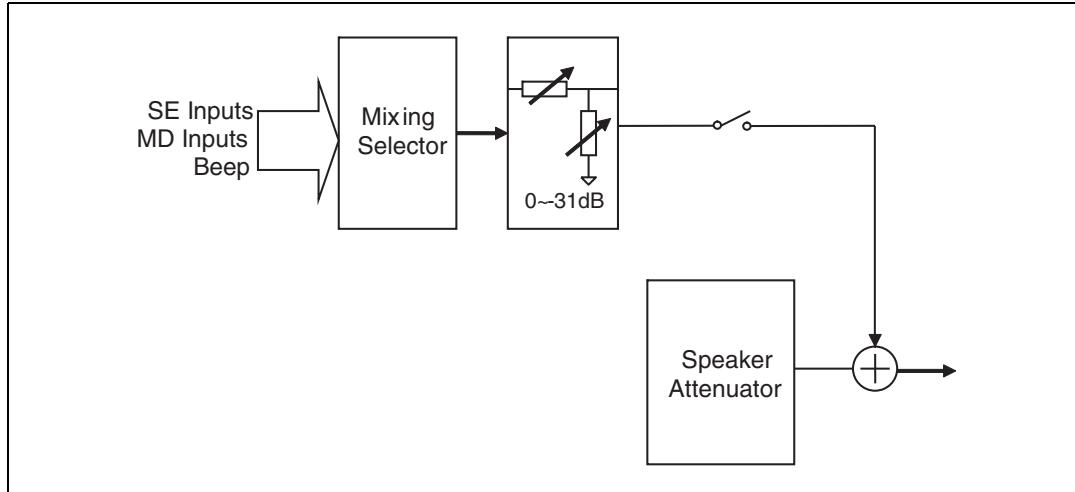

Pin5/QD2L	--> OUTLF
Pin6/QD2R	--> OUTRF
Pin7/QD3L	--> OUTLR
Pin9/QD3R	--> OUTRR
Pin10/FDL+_QD4L	--> OUTL2
Pin13/FDR+_QD4R	--> OUTR2

- Note:**
- 1 *The configurations CFG2, CFG3 and CFG5 are not recommended in direct path mode. Because in these 3 configurations SE4L/MD1+ and SE5R/MD2+ are connected to OUT2_L and OUT2_R fader separately. In this case left and right channel of OUT2 belongs to different input sources.*
 - 2 *If the direct path is chosen, the input pins have to be used as single ended pins. In case of differential inputs the ground or minus pins must be connect to GND by AC short.*
 - 3 *Inputs in direct path mode are also selectable with front and rear selector.*

4.2 Mixing

The device provides mixing function which allows the mixing source mixed into front and rear speaker output independently. The mixing source can be any single-ended input, mono-differential input or beep input (Mono single-ended input when DC offset detector is not used). In order to adjust the level of mixing signal, the mixing selector is followed with a 0 dB~31 dB attenuator. The maximum mixing input signal level is 1.6 Vrms for single-ended input and mono-differential input. For beep input, the maximum input signal level is about 1.4 Vrms. The block diagram of the mixing function is shown below.

Figure 4. Block diagram of mixing stage

Since the input stage of this device has different configurations, the corresponding sources for mixing selector are also different according to the configurations. The following table defines the available sources for mixing under different configurations.

Table 8. Available sources for mixing

Mix selector bits (Byte2 Bit2~Bit0)	000	001	010	011	100	101	110	111
	MixIN0	MixIN1	MixIN2	MixIN3	MixIN4	MixIN5	MixIN6	MixIN7
CFG0	NA	NA	NA	NA	NA	NA	Beep	Mute
CFG1	SE1	SE2	SE3	NA	NA	NA	Beep	Mute

CFG7	SE1	SE2	SE3	NA	NA	NA	Beep	Mute

Note: Only light grey cells are allowed mixing input. The dark grey cells are not allowed.
The beep input is available only when DC offset detector function is not used.

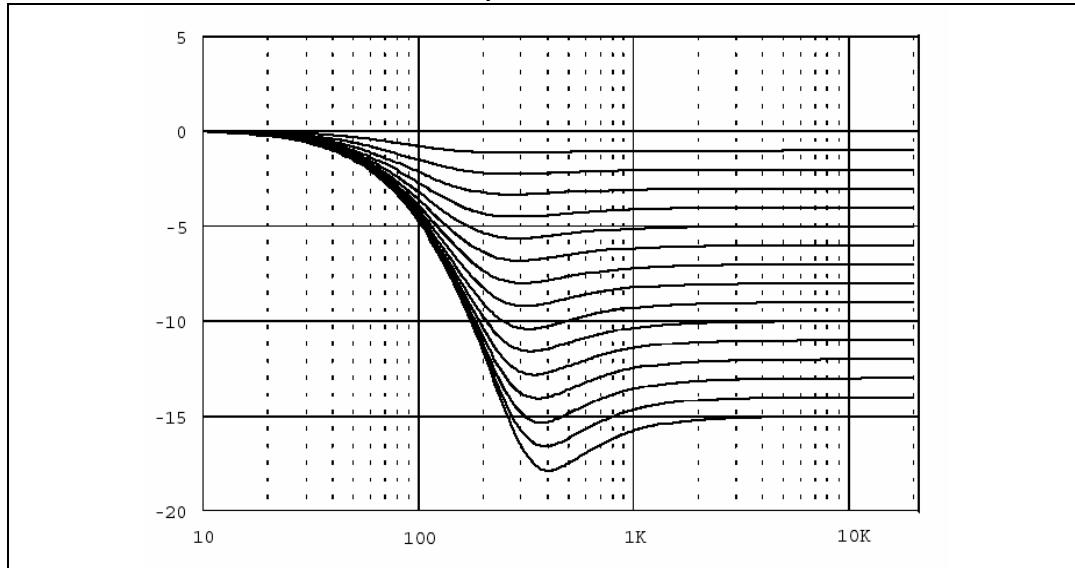

4.3 Loudness

There are four parameters programmable in the loudness stage:

4.3.1 Loudness attenuation

Figure 5 shows the attenuation as a function of frequency at $f_P = 400$ Hz

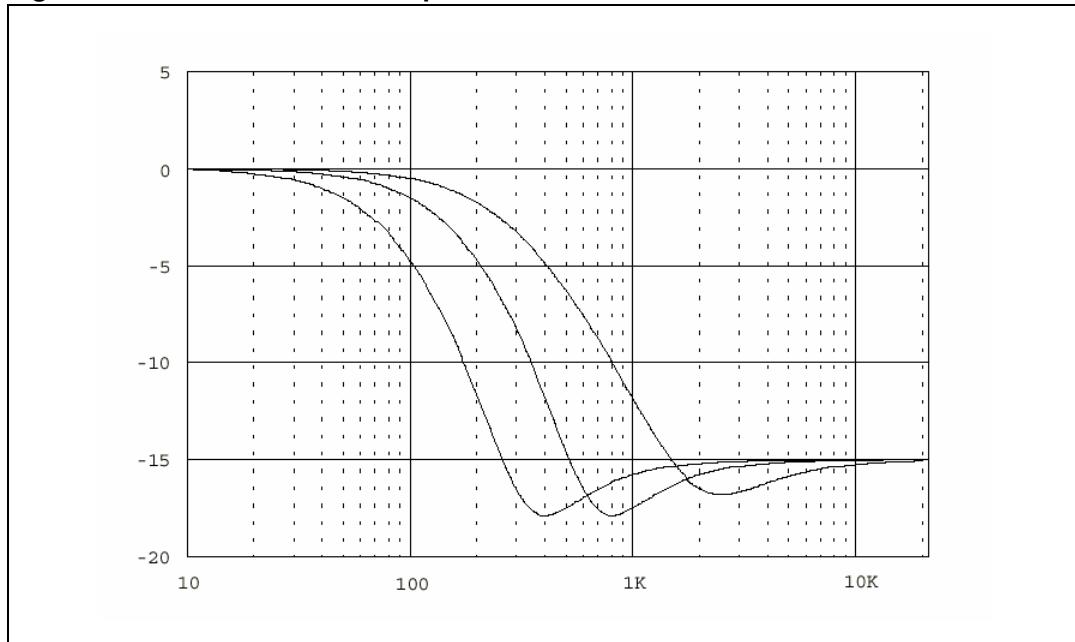

Figure 5. Loudness attenuation @ $f_P = 400$ Hz.

4.3.2 Peak frequency

Figure 6 shows the four possible peak-frequencies at 400, 800 and 2400 Hz

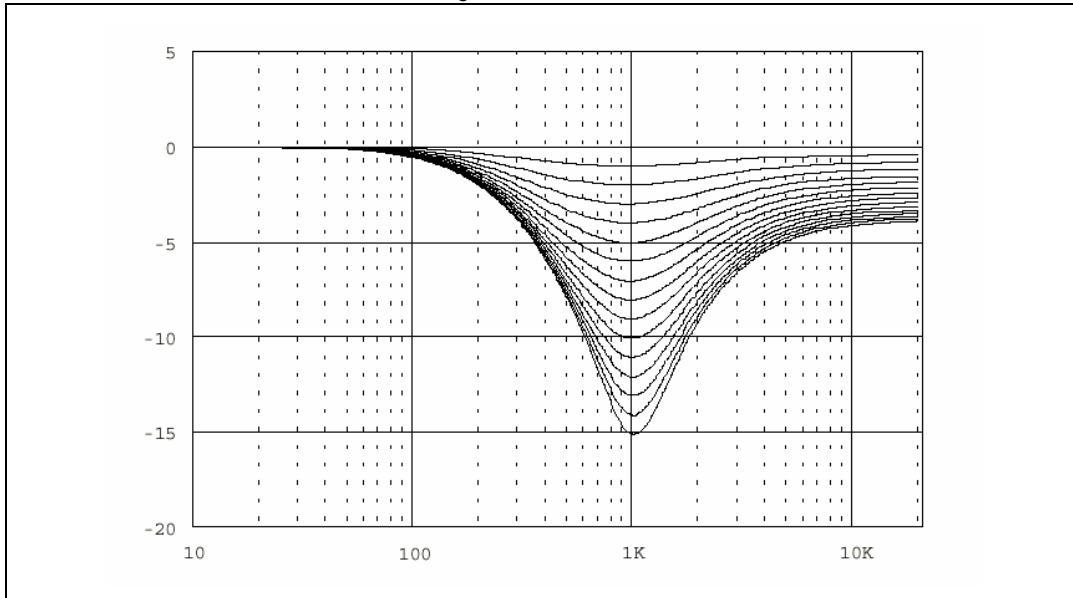

Figure 6. Loudness center frequencies @ Attn. = 15 dB.

4.3.3 High frequency boost

Figure 7 shows the different Loudness shapes in low and high frequency boost.

Figure 7. Loudness attenuation, $f_c = 2.4$ kHz

4.3.4 Flat mode

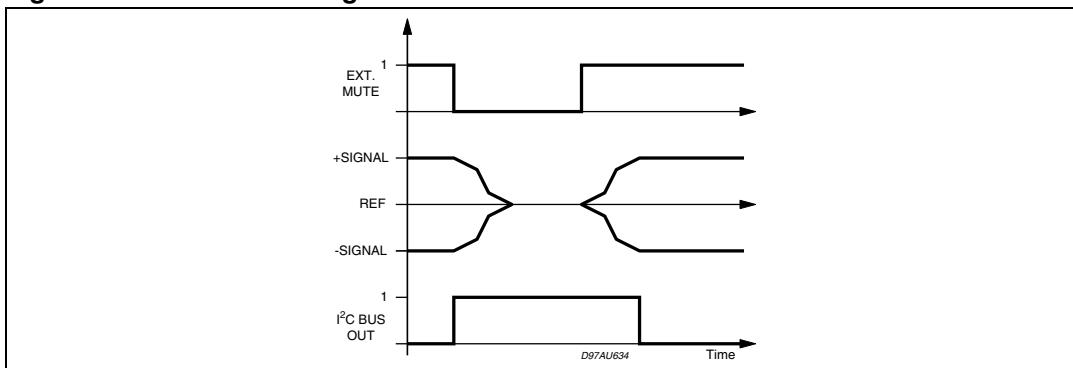

In flat mode the loudness stage works as a 0dB to -15dB attenuator.

4.4 SoftMute

The digitally controlled SoftMute stage allows muting/demuting the signal with a I²C-bus programmable slope. The mute process can either be activated by the SoftMute pin or by the I²C-bus. This slope is realized in a special S-shaped curve to mute slow in the critical regions (see *Figure 8*).

For timing purposes the Bit0 of the I²C-bus output register is set to 1 from the start of muting until the end of demuting.

Figure 8. SoftMute timing

1. A started Mute action is always terminated and could not be interrupted by a change of the mute signal.

4.5 Softstep volume

When the volume-level is changed audible clicks could appear at the output. The root cause of those clicks could either be a DC Offset before the volume-stage or the sudden change of the envelope of the audio signal. With the Softstep feature both kinds of clicks could be reduced to a minimum and are no more audible. The blend-time from one step to the next is programmable as 5 ms or 10 ms. The softstep control is described in detail in [Chapter 4.10](#).

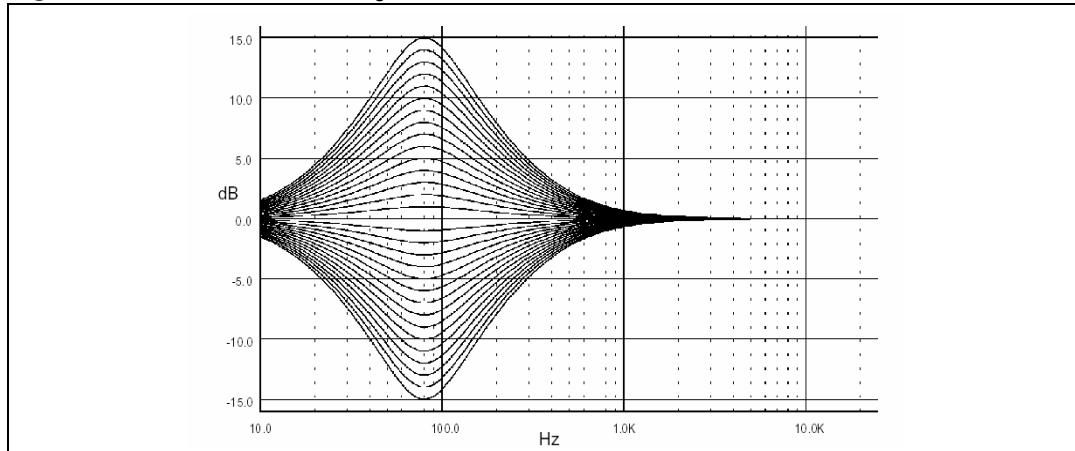

4.6 Bass

There are four parameters programmable in the bass stage:

4.6.1 Bass attenuation

[Figure 9](#) shows the attenuation as a function of frequency at a center frequency of 80 Hz.

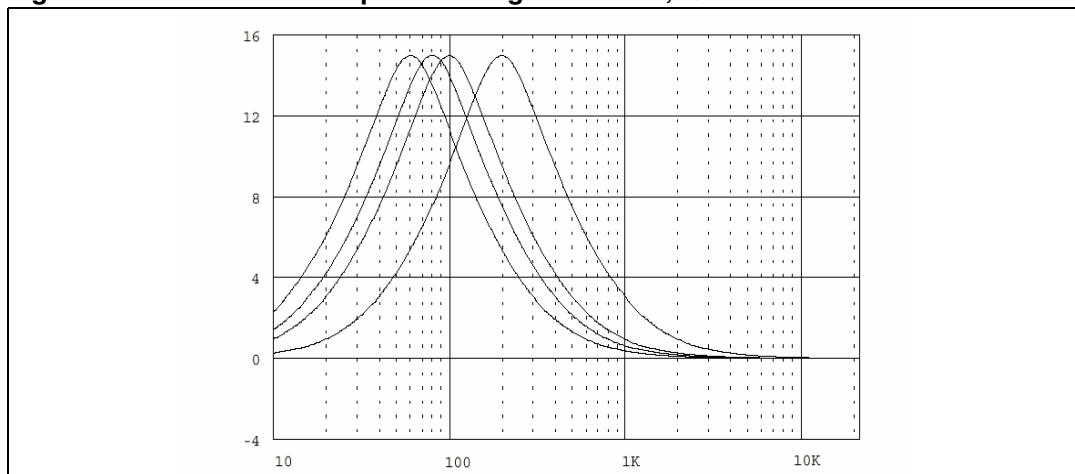

Figure 9. Bass Control @ $f_c = 80$ Hz, Q = 1

4.6.2 Bass center frequency

[Figure 10](#) shows the four possible center frequencies 60, 80, 100 and 200 Hz.

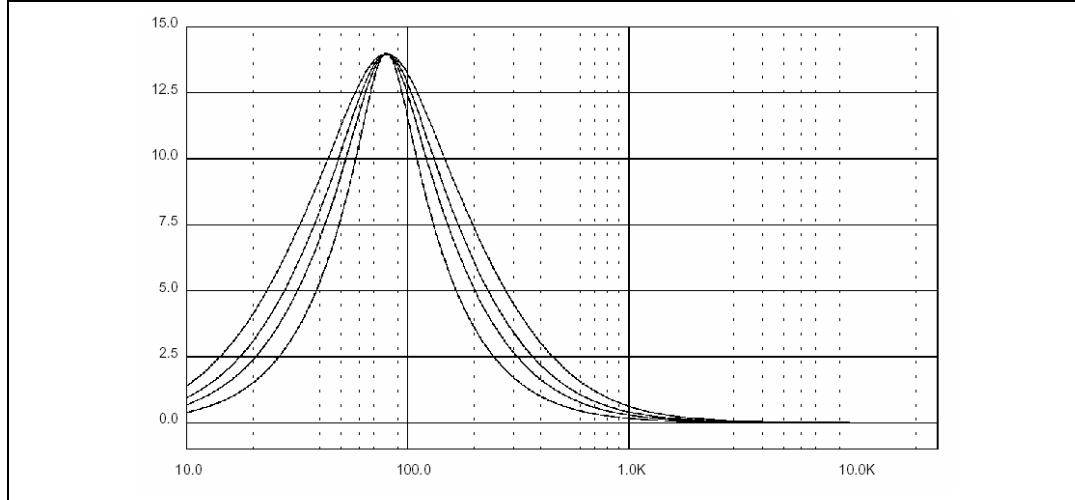

Figure 10. Bass center frequencies @ gain = 14 dB, Q = 1

4.6.3 Bass quality factors

Figure 11 shows the four possible quality factors 1, 1.25, 1.5 and 2.

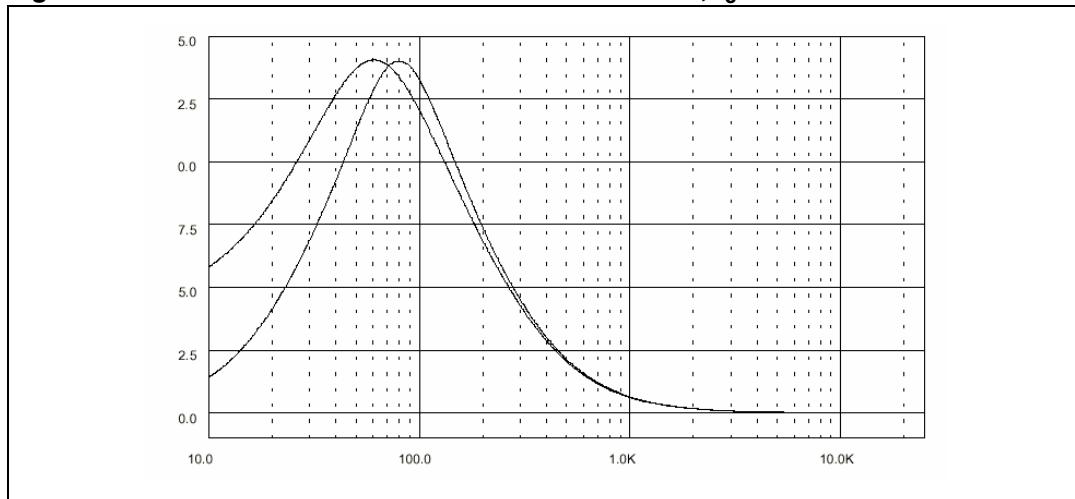

Figure 11. Bass quality factors @ gain = 14 dB, f_c = 80 Hz

4.6.4 DC mode

In this mode the DC gain is increased by 4.4 dB. In addition the programmed center frequency and quality factor is decreased by 25 % which can be used to reach alternative center frequencies or quality factors.

Figure 12. Bass normal and DC mode @ Gain = 14 dB, f_c = 80 Hz

1. The center frequency, Q and DC-mode can be set fully independently.

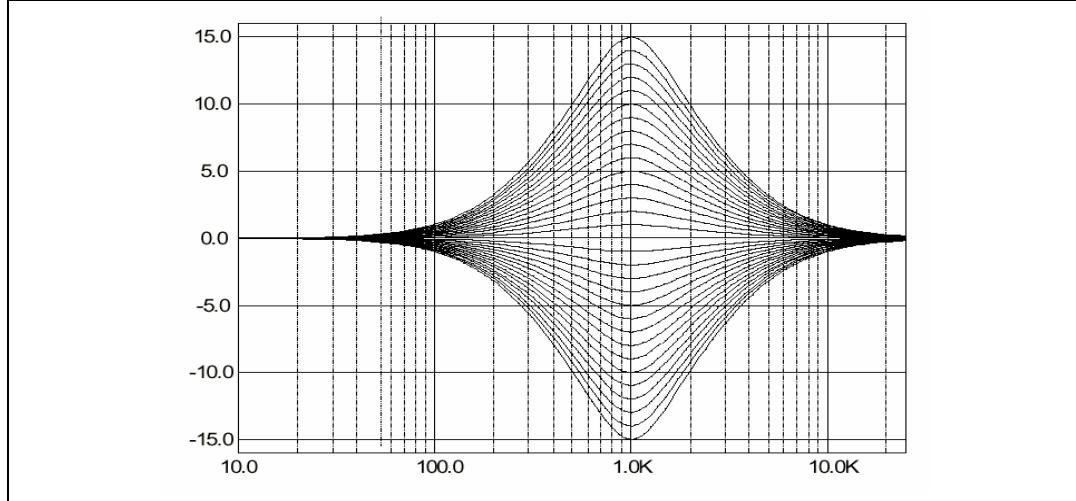

4.7 Middle

There are three parameters programmable in the middle stage:

4.7.1 Middle attenuation

Figure 13 shows the attenuation as a function of frequency at a center frequency of 1 kHz.

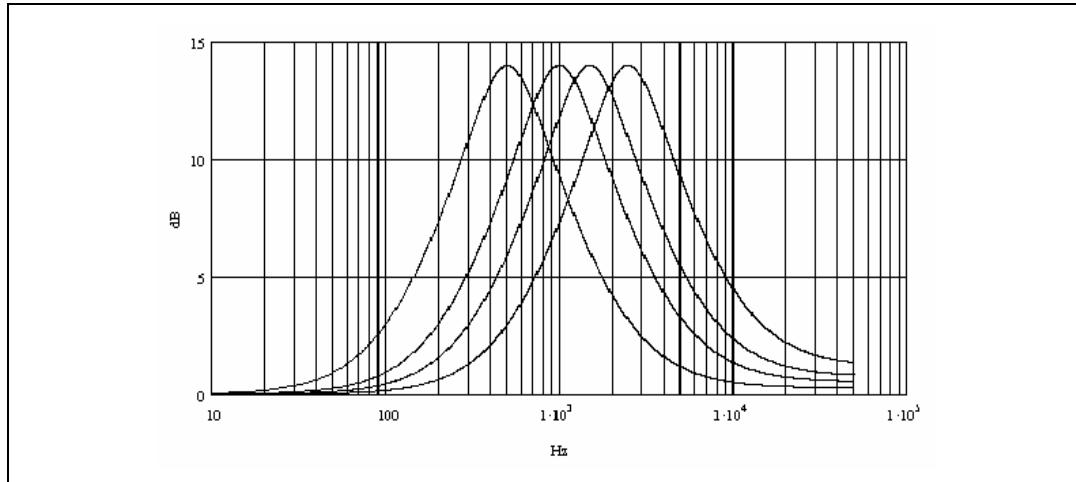

Figure 13. Middle control @ $f_c = 1$ kHz, Q = 1

4.7.2 Middle center frequency

Figure 14 shows the four possible center frequencies 500 Hz, 1 kHz, 1.5 kHz and 2.5 kHz.

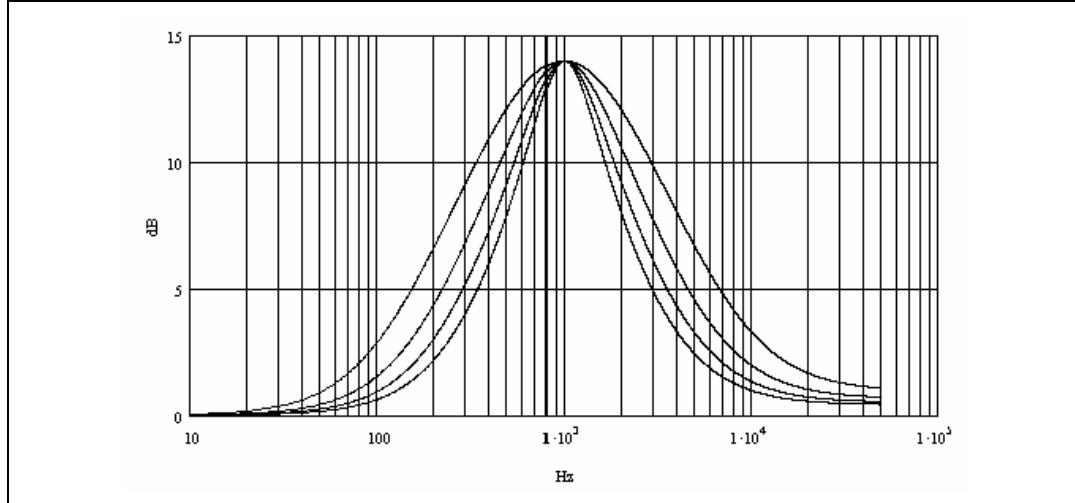

Figure 14. Middle center frequencies @ gain = 14dB, Q = 1

4.7.3 Middle quality factors

Figure 15 shows the four possible quality factors 0.5, 0.75, 1 and 1.25.

Figure 15. Middle quality factors @ gain = 14 dB, $f_c = 1 \text{ kHz}$

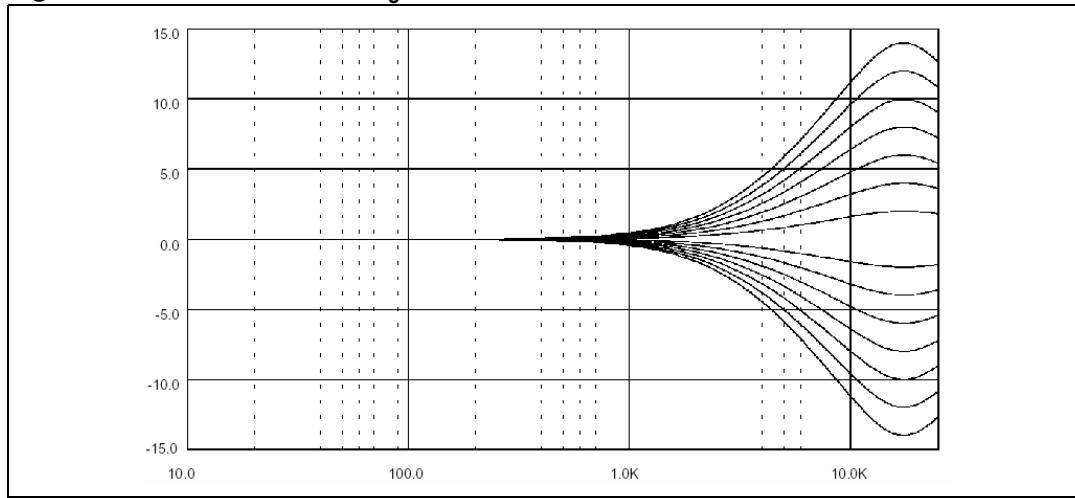

4.8 Treble

There are two parameters programmable in the treble stage:

4.8.1 Treble attenuation

Figure 16 shows the attenuation as a function of frequency at a center frequency of 17.5 kHz.

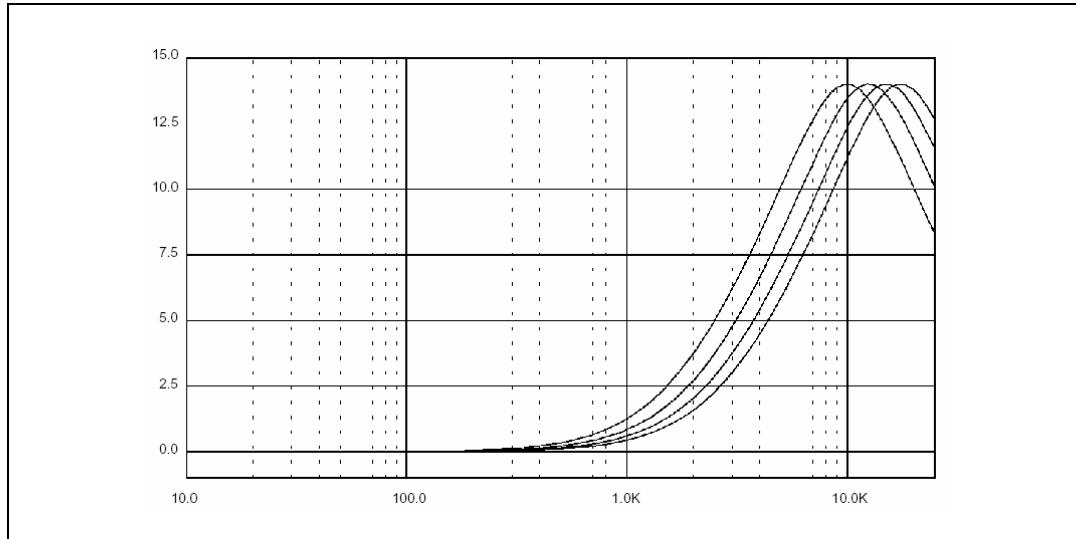

Figure 16. Treble Control @ $f_c = 17.5 \text{ kHz}$.

4.8.2 Treble center frequency

Figure 17 shows the four possible center frequencies 10 k, 12.5 k, 15 k and 17.5 kHz.

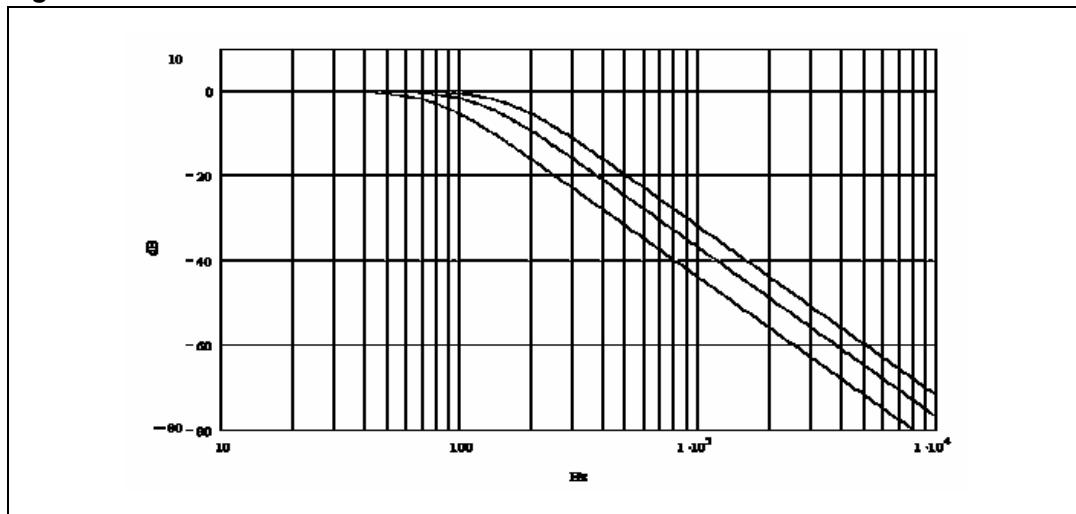

Figure 17. Treble center frequencies @ gain = 14 dB

4.9 Subwoofer Filter

The subwoofer lowpass filter has Butterworth characteristics with programmable cut-off frequency (80 / 120 / 160 Hz). The output phase can be selected between 0 deg and 180 deg. The input of subwoofer takes signal from bass filter output or output of input mux.

Figure 18. Subwoofer control

4.10 Softstep control

In this device, the softstep function is available for volume, speaker, loudness, treble, middle and bass block. With softstep function, the audible noise of DC offset or the sudden change of signal can be avoided when adjusting gain setting of the block.

For each block, the softstep function is controlled by softstep on/off control bit in the control table. The softstep transient time selection (5 ms or 10 ms) is common for all blocks and it is controlled by softstep time control bit. The softstep operation of all blocks has a common centralized control. In this case, a new softstep operation can not be started before the completion previous softstep.

There are two different modes to activate the softstep operation. The softstep operation can be started right after I²C data sending, or the softstep can be activated in parallel after data sending of several different blocks. The two modes are controlled by the 'act bit' (it is normally bit7 of the byte.) of each byte. When act bit is '0', which means action, the softstep is activated right after the date byte is sent. When the act bit is '1', which means wait, the block goes to wait for softstep status. In this case, the block will wait for some other block to activate the operation. The softstep operation of all blocks in wait status will be done together with the block which activate the softstep. With this mode, all specific blocks can do the softstep in parallel. This avoids waiting when the softstep is operated one by one.

Chip Addr	Sub Addr	0xxxxxxx
-----------	----------	----------

↑ Softstep start here

Chip Addr	Sub Addr	1xxxxxxxx	1xxxxxxxx	0xxxxxxxx
-----------	----------	-----------	-----------	-------	-----------

↑ Softstep start here for all

1. It is not allowed to cross 0 dB with softstep directly. From plus gain to minus gain, it must go to +0 dB first, then destination. From minus gain to plus gain, it must go to -0 dB first, and then destination.
2. When one block is in 'wait for softstep' status, it is not allowed to send data to this block again before its softstep is completed.
3. To know if there is a softstep in operation, it is possible to monitor the 'busy' signal by I²C transmission mode ([Section 5.1.2](#)). When softstep is busy (busy=0), it is better to wait before sending new data until it is free (busy=1).

4.11 DC offset detector and level meter option

This device provide DC offset detector function and level meter function option. In one specific application, only one of the function can be used. The configuration of the function is controlled by I²C bus (Byte3 Bit7).

When the device uses DC offset detector function, Pin22, Pin27 and Pin28 are used as WinTC, DCErr and WinIN for DC offset detector. When it is configured as level meter, DCErr becomes level meter output. In the mean time, WinIN is used as beep input (Mono single-ended input for mixing), and WinTC becomes a reference voltage output (4 V external DC voltage or 3.3 V internal reference voltage).

4.12 DC offset detector

Using the DC offset detection circuit (*Figure 19*) an offset voltage difference between the audio power amplifier and the TDA7719's Front and Rear outputs can be detected, preventing serious damage to the loudspeakers. The circuit compares whether the signal crosses the zero level inside the audio power at the same time as in the speaker cell. The output of the zero-window-comparator of the power amplifier must be connected with the WinIn-input of the TDA7719. The WinIn-input has an internal pull-up resistor connected to 5.5Volts. It is recommended to drive this pin with open-collector outputs only.

To compensate for errors at low frequencies the WinTC-pin are implemented, with external capacitors introducing the same delay $\tau = 7.5k\Omega * C_{ext}$ as the AC-coupling between the TDA7719 and the power amplifier introduces. For the zero window comparators, the time constant for spike rejection as well as the threshold are programmable.

For electrical characteristics see [Chapter 3 on page 9](#).

A low-active DC-offset error signal appears at the DCErr output if the next conditions are both true:

- a) Front and rear outputs are inside zero crossing windows.
- b) The Input voltage VWinIn is logic low whenever at least one output of the power amplifier is outside the zero crossing windows.

After power-on, the external attached capacitor is rapidly charged (fast-charge) to overcome a false indication.
