

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1 Product Description

1.1 Overview

The TDK 5111 F is a single chip ASK/FSK transmitter for operation in the frequency band 311 ... 317 MHz. The IC offers a high level of integration and needs only a few external components. The device contains a fully integrated PLL synthesizer and a high efficiency power amplifier to drive a loop antenna. A special circuit design and an unique power amplifier design are used to save current consumption and therefore to save battery life. Additional features are a power down mode and a divided clock output.

1.2 Features

- fully integrated frequency synthesizer
- VCO without external components
- ASK and FSK modulation
- frequency range 311 ... 317 MHz
- high efficiency power amplifier (typically 10 dBm)
- low supply current
- voltage supply range 2.1 ... 4 V
- temperature range -40 ... +125°C
- power down mode
- crystal oscillator 9.84 MHz
- FSK-switch
- divided clock output for μC
- low external component count

1.3 Application

- Tire pressure monitoring systems
- Keyless entry systems
- Remote control systems
- Alarm systems
- Communication systems

Pin No.	Symbol	Interface Schematic	Function
1	CLKOUT		<p>Clock output to supply an external device.</p> <p>An external pull-up resistor has to be added in accordance to the driving requirements of the external device.</p> <p>The clock frequency is 615.2 kHz.</p>
2	VS		<p>This pin is the positive supply of the transmitter electronics.</p> <p>An RF bypass capacitor should be connected directly to this pin and returned to GND (pin 3) as short as possible.</p>
3	GND		General ground connection.
4	FSKOUT		<p>This pin is connected to a switch to GND (pin 3).</p> <p>The switch is closed when the signal at FSKDTA (pin 7) is in a logic low state.</p> <p>The switch is open when the signal at FSKDTA (pin 7) is in a logic high state.</p> <p>FSKOUT can switch an additional capacitor to the reference crystal network to pull the crystal frequency by an amount resulting in the desired FSK frequency shift of the transmitter output frequency.</p>

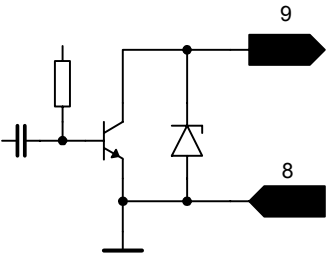

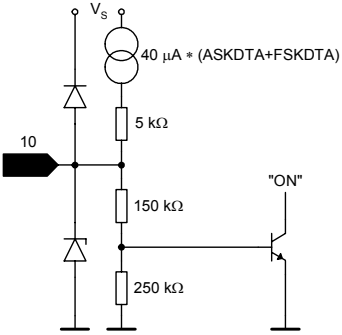

Functional Description

Pin No.	Symbol	Interface Schematic	Function
5	COSC	 <p>The schematic for Pin 5 (COSC) shows a circuit connected to a supply voltage V_S. A $6\text{ k}\Omega$ resistor is connected to the base of an NPN transistor. The emitter of the transistor is connected to ground. The collector of the transistor is connected to the anode of a diode. The cathode of this diode is connected to the anode of another diode, which is connected to ground. The junction between the two diodes is connected to Pin 5. A current source of $100\text{ }\mu\text{A}$ is connected to the base of the transistor.</p>	<p>This pin is connected to the reference oscillator circuit. The reference oscillator is working as a negative impedance converter. It presents a negative resistance in series to an inductance at the COSC pin.</p>
6	ASKDTA	 <p>The schematic for Pin 6 (ASKDTA) shows a circuit connected to a supply voltage V_S. A diode is connected between V_S and Pin 6. The other end of Pin 6 is connected to a $90\text{ k}\Omega$ resistor, which is connected to a $+1.2\text{ V}$ supply. A $60\text{ k}\Omega$ resistor is also connected to the $+1.2\text{ V}$ supply. The junction of the $90\text{ k}\Omega$ and $60\text{ k}\Omega$ resistors is connected to the base of an NPN transistor. The emitter of the transistor is connected to ground. The collector of the transistor is connected to a $+1.1\text{ V}$ supply. A 2.3 pF capacitor and a $30\text{ }\mu\text{A}$ current source are connected to the base of the transistor.</p>	<p>Digital amplitude modulation can be imparted to the Power Amplifier through this pin.</p> <p>A logic high (ASKDTA > 1.5 V or open) enables the Power Amplifier.</p> <p>A logic low (ASKDTA < 0.5 V) disables the Power Amplifier.</p>

Functional Description

Pin No.	Symbol	Interface Schematic	Function
7	FSKDTA		<p>Digital frequency modulation can be imparted to the Xtal Oscillator by this pin. The VCO-frequency varies in accordance to the frequency of the reference oscillator.</p> <p>A logic high (FSKDTA > 1.5V or open) sets the FSK switch to a high impedance state.</p> <p>A logic low (FSKDTA < 0.5 V) closes the FSK switch from FSKOUT (pin 4) to GND (pin 3). A capacitor can be switched to the reference crystal network this way. The Xtal Oscillator frequency will be shifted giving the designed FSK frequency deviation.</p>

Functional Description

Pin No.	Symbol	Interface Schematic	Function
8	PAGND	 <p>The diagram shows a transistor circuit. The base is connected to a positive supply VS through a resistor. The emitter is connected to ground. The collector is connected to pin 9. A diode is connected between the collector and pin 8. Pin 8 is also connected to ground through a resistor.</p>	<p>Ground connection of the power amplifier.</p> <p>The RF ground return path of the power amplifier output PAOUT (pin 9) has to be concentrated to this pin.</p>
9	PAOUT		<p>RF output pin of the transmitter.</p> <p>A DC path to the positive supply VS has to be supplied by the antenna matching network.</p>
10	PDWN	 <p>The diagram shows a pull-up circuit for pin 10. Pin 10 is connected to VS through a 40 μA current source (labeled 40 μA * (ASKDTA+FSKDTA)). A 5 kΩ resistor is connected between pin 10 and a node. This node is connected to ground through a 150 kΩ resistor. Another 250 kΩ resistor is connected between this node and ground. A transistor is connected between this node and ground, with its base connected to pin 10 and its emitter to ground. The transistor is labeled "ON".</p>	<p>Disable pin for the complete transmitter circuit.</p> <p>A logic low (PDWN < 0.7 V) turns off all transmitter functions.</p> <p>A logic high (PDWN > 1.5 V) gives access to all transmitter functions.</p> <p>PDWN input will be pulled up by 40 μA internally by either setting FSKDTA or ASKDTA to a logic high-state.</p>

1) Indicated voltages and currents apply for PLL Enable Mode and Transmit Mode.
In Power Down Mode, the values are zero or high-ohmic.

2.3 Functional Block Diagram

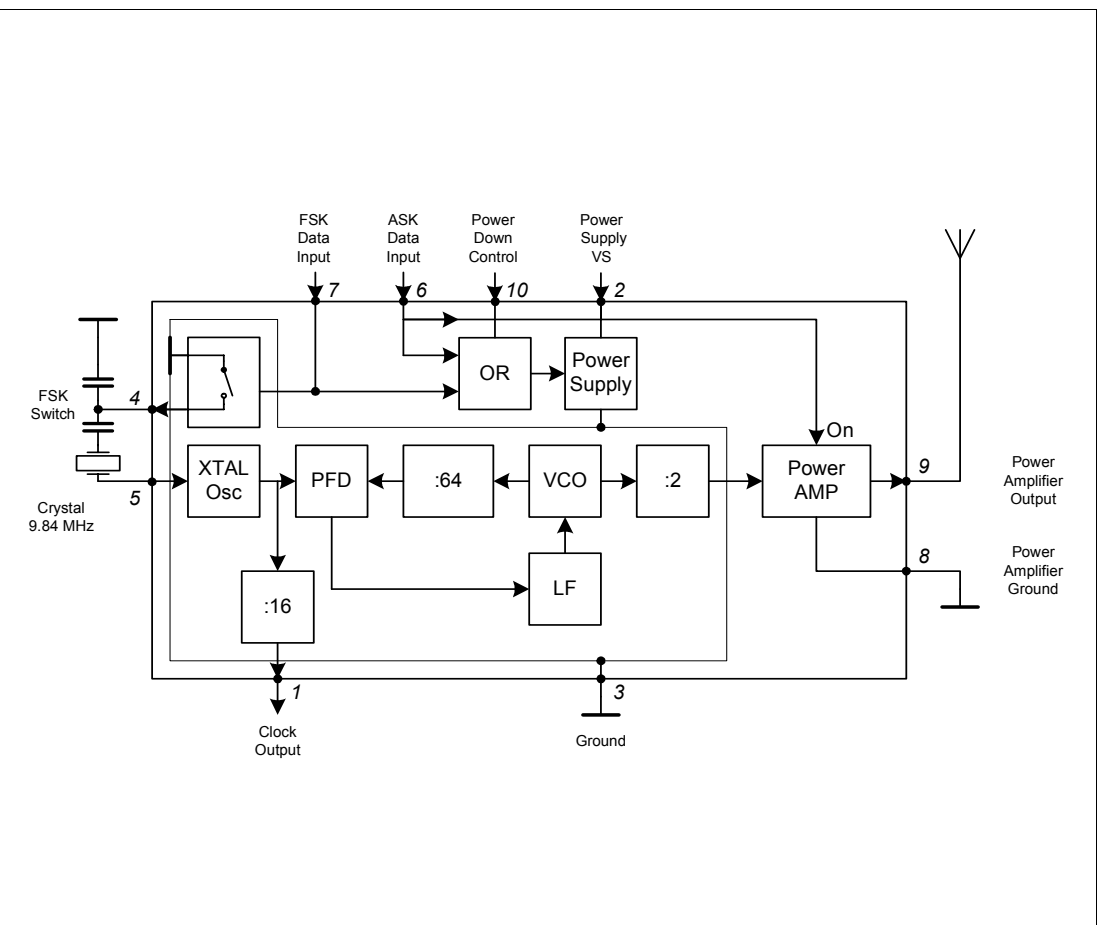

Figure 2 Functional Block Diagram

2.4 Functional Block Description

2.4.1 PLL Synthesizer

The Phase Locked Loop synthesizer consists of a Voltage Controlled Oscillator (VCO), an asynchronous divider chain, a phase detector, a charge pump and a loop filter. It is fully implemented on chip. The tuning circuit of the VCO consisting of spiral inductors and varactor diodes is on chip, too. Therefore no additional external components are necessary. The nominal center frequency of the VCO is 630MHz. The oscillator signal is fed both, to the synthesizer divider chain and (via a 1:2 divider) to the power amplifier. The overall division ratio of the asynchronous synthesizer divider chain is 64. The phase detector is a Type IV PD with charge pump. The passive loop filter is realized on chip.

2.4.2 Crystal Oscillator

The crystal oscillator operates at 9.84 MHz.

The crystal frequency is divided by 16. The resulting 615.2 kHz are available at the clock output CLKOUT (pin1) to drive the clock input of a micro controller.

To achieve FSK transmission, the oscillator frequency can be detuned by a fixed amount by switching an external capacitor via FSKOUT (pin 4).

The condition of the switch is controlled by the signal at FSKDTA (pin 7).

Table 4 FSKDTA - FSK Switch

FSKDTA (pin7)	FSK Switch
Low ¹⁾	CLOSED
Open ²⁾ , High ³⁾	OPEN

1) Low: Voltage at pin < 0.5V

2) Open: Pin open

3) High: Voltage at pin > 1.5V

2.4.3 Power Amplifier

The VCO frequency is divided by 2 and fed to the Power Amplifier.

The Power Amplifier can be switched on and off by the signal at ASKDTA (pin 6).

Table 5 ASKDTA - Power Amplifier

ASKDTA (pin6)	Power Amplifier
Low ¹⁾	OFF
Open ²⁾ , High ³⁾	ON

- 1) Low: Voltage at pin < 0.5V
 2) Open: Pin open
 3) High: Voltage at pin > 1.5V

The Power Amplifier has an Open Collector output at PAOUT (pin 9) and requires an external pull-up coil to provide bias. The coil is part of the tuning and matching LC circuitry to get best performance with the external loop antenna. To achieve the best power amplifier efficiency, the high frequency voltage swing at PAOUT (pin 9) should be twice the supply voltage.

The power amplifier has its own ground pin PAGND (pin 8) in order to reduce the amount of coupling to the other circuits.

2.4.4 Power Modes

The IC provides three power modes, the POWER DOWN MODE, the PLL ENABLE MODE and the TRANSMIT MODE.

2.4.4.1 Power Down Mode

In the POWER DOWN MODE the complete chip is switched off.

The current consumption is typically 0.3 nA at 3 V 25°C.

This current doubles every 8°C. The values for higher temperatures are typically 14 nA at 85°C and typically 600 nA at 125°C.

2.4.4.2 PLL Enable Mode

In the PLL ENABLE MODE the PLL is switched on but the power amplifier is turned off to avoid undesired power radiation during the time the PLL needs to settle. The settling time of the PLL is determined mainly by the turn on time of the crystal oscillator and is in the range of 1 msec depending on the used crystal.

The current consumption is typically 4mA.

Functional Description

2.4.4.3 Transmit Mode

In the TRANSMIT MODE the PLL is switched on and the power amplifier is turned on too. The current consumption of the IC is typically 14 mA when using a proper transforming network at PAOUT, see Figure 8.

2.4.4.4 Power mode control

The bias circuitry is powered up via a voltage $V > 1.5$ V at the pin PDWN (pin10). When the bias circuitry is powered up, the pins ASKDTA and FSKDTA are pulled up internally.

Forcing the voltage at the pins low overrides the internally set state.

Alternatively, if the voltage at ASKDTA or FSKDTA is forced high externally, the PDWN pin is pulled up internally via a current source. In this case, it is not necessary to connect the PDWN pin, it is recommended to leave it open.

The principle schematic of the power mode control circuitry is shown in Figure 3

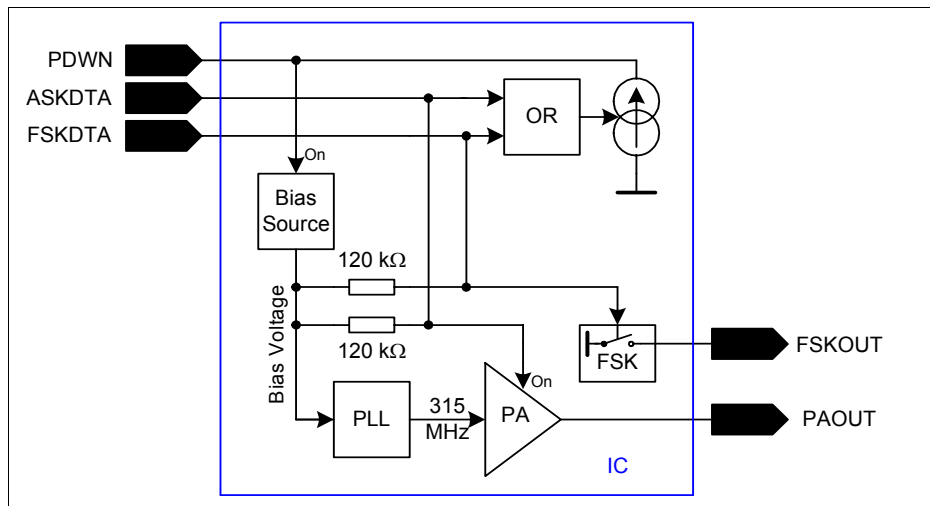

Figure 3 Power mode control circuitry

Functional Description

Table 6 provides a listing of how to get into the different power modes

Table 6 Power Modes

PDWN	FSKDTA	ASKDTA	MODE
Low ¹⁾	Low, Open	Low, Open	POWER DOWN
Open ²⁾	Low	Low	
High ³⁾	Low, Open, High	Low	PLL ENABLE
Open	High	Low	
High	Low, Open, High	Open, High	TRANSMIT
Open	High	Open, High	
Open	Low, Open, High	High	

- 1) Low: Voltage at pin < 0.7V (PDWN)
 Voltage at pin < 0.5V (FSKDTA, ASKDTA)
- 2) Open: Pin open
- 3) High: Voltage at pin > 1.5V

Other combinations of the control pins PDWN, FSKDTA and ASKDTA are not recommended.

Functional Description

2.4.5 Recommended Timing Diagrams for ASK- and FSK-Modulation

ASK Modulation using FSKDTA and ASKDTA, PDWN not connected

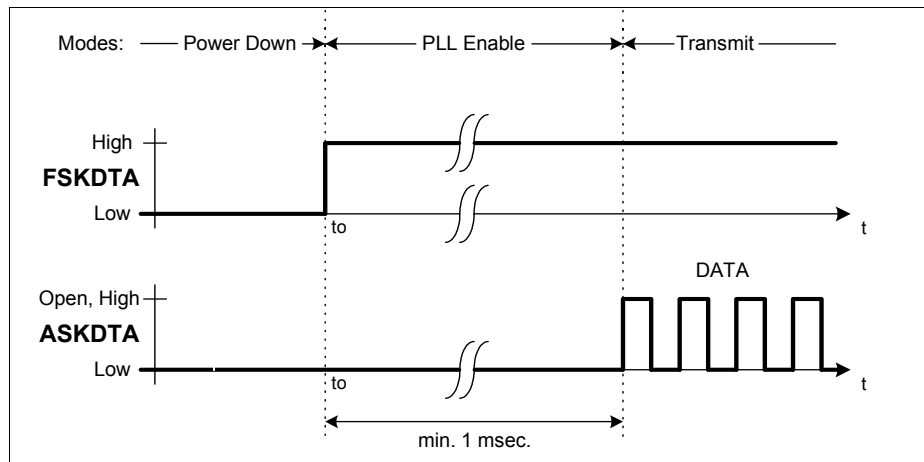

Figure 4 ASK Modulation

FSK Modulation using FSKDTA and ASKDTA, PDWN not connected.

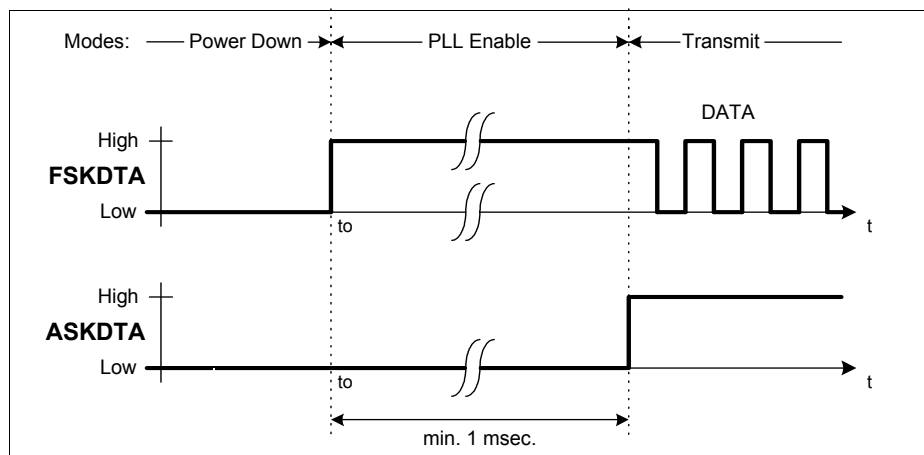

Figure 5 FSK Modulation

In case of FSK Modulation without using PDWN it should be considered, that a too small value of C2 (referring to Figure 8 and the BOM) could possibly enlarge the start-up time of the oscillator significantly.

3.4 Application Hints on the Crystal Oscillator

Application Hints on the crystal oscillator

The crystal oscillator achieves a turn on time in the range of 1 msec depending on the used crystal. To achieve this, a NIC oscillator type is implemented in the TDK 5111 F. The input impedance of this oscillator is a negative resistance in series to an inductance. Therefore the load capacitance of the crystal C_L (specified by the crystal supplier) is transformed to the capacitance C_v .

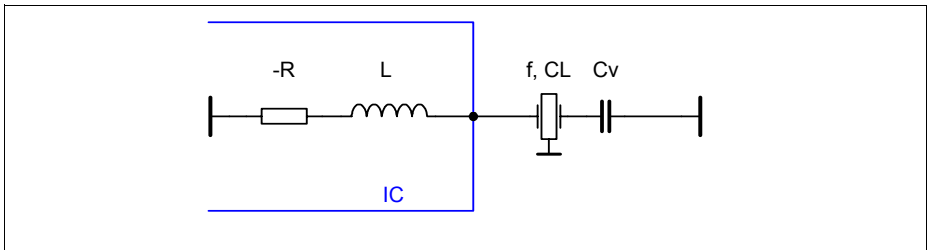

Figure 11 Application Hints

Formula 1:

$$C_v = \frac{1}{\frac{1}{CL} + \omega^2 L}$$

CL: crystal load capacitance for nominal frequency

ω : angular frequency

L: inductance of the crystal oscillator

Example for the ASK-Mode:

Referring to the application circuit, in ASK-Mode the capacitance C_2 is replaced by a short to ground. Assume a crystal frequency of 9.84 MHz and a crystal load capacitance of $C_L = 12$ pF. The inductance L at 9.84 MHz is about $4.6 \mu\text{H}$. Therefore C_1 is calculated to 10 pF.

$$C_v = \frac{1}{\frac{1}{CL} + \omega^2 L} = C_1$$

Example for the FSK-Mode:

FSK modulation is achieved by switching the load capacitance of the crystal as shown below.

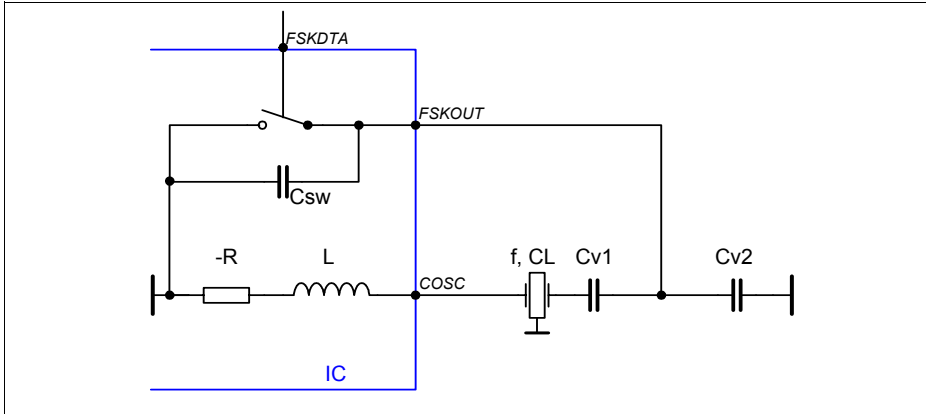

Figure 12 FSK Mode

The frequency deviation of the crystal oscillator is multiplied with the divider factor N of the Phase Locked Loop to the output of the power amplifier. In case of small frequency deviations (up to +/- 400 ppm), the two desired load capacitances can be calculated with the formula below.

$$CL_{\pm} = \frac{CL \mp C_0 \frac{\Delta f}{N * f_1} \left(1 + \frac{2(C_0 + CL)}{C_1}\right)}{1 \pm \frac{\Delta f}{N * f_1} \left(1 + \frac{2(C_0 + CL)}{C_1}\right)}$$

C_L : crystal load capacitance for nominal frequency

C_0 : shunt capacitance of the crystal

f: frequency

ω : $\omega = 2\pi f$: angular frequency

N: division ratio of the PLL

df: peak frequency deviation

Because of the inductive part of the TDK 5111 F, these values must be corrected by Formula 1 on the preceding page. The value of $C_{v\pm}$ can be calculated.

$$C_{V\pm} = \frac{1}{\frac{1}{CL\pm} + \omega^2 L}$$

If the FSK switch is closed, $C_{V\pm}$ is equal to C_{V1} ($C1$ in the application diagram). If the FSK switch is open, C_{V2} ($C2$ in the application diagram) can be calculated.

$$C_{V2} = C2 = \frac{C_{sw} * C_{V1} - (C_{V+}) * (C_{V1} + C_{sw})}{(C_{V+}) - C_{V1}}$$

C_{sw} : parallel capacitance of the FSK switch (3 pF incl. layout parasitics)

Remark: These calculations are only approximations. The necessary values depend on the layout also and must be adapted for the specific application board.

3.5 Design Hints on the Clock Output (CLKOUT)

The CLKOUT pin is an open collector output. An external pull up resistor (R_L) should be connected between this pin and the positive supply voltage. The value of R_L is depending on the clock frequency and the load capacitance CLD (PCB board plus input capacitance of the microcontroller). R_L can be calculated to:

$$R_L = \frac{1}{f_{CLKOUT} * 8 * CLD}$$

Table 7 Clock Output

fCLKOUT=615.2 kHz	
CL[pF]	RL[kOhm]
5	39
10	18
20	10

Remark: To achieve a low current consumption and a low spurious radiation, the largest possible R_L should be chosen.

Even harmonics of the signal at CLKOUT can interact with the crystal oscillator input COSC preventing the start-up of oscillation. Care must be taken in layout by sufficient separation of the signal lines to ensure sufficiently small coupling.

3.6 Application Hints on the Power-Amplifier

The power amplifier operates in a high efficient class C mode. This mode is characterized by a pulsed operation of the power amplifier transistor at a current flow angle of $\theta \ll \pi$. A frequency selective network at the amplifier output passes the fundamental frequency component of the pulse spectrum of the collector current to the load. The load and its resonance transformation to the collector of the power amplifier can be generalized by the equivalent circuit of Figure 13. The tank circuit $L//C//R_L$ in parallel to the output impedance of the transistor should be in resonance at the operating frequency of the transmitter.

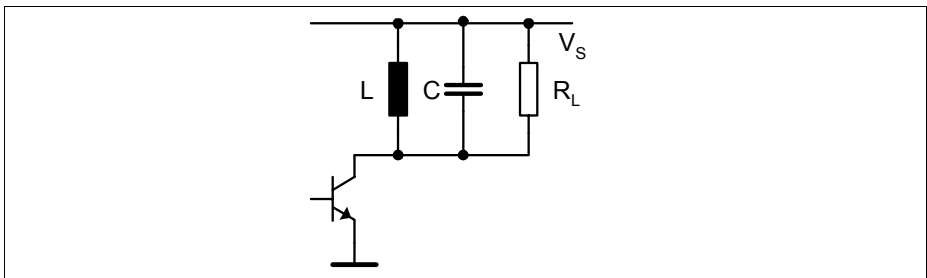

Figure 13 Equivalent power amplifier tank circuit

The optimum load at the collector of the power amplifier for “critical” operation under idealized conditions at resonance is:

$$R_{LC} = \frac{V_S^2}{2 * P_o}$$

The theoretical value of R_{LC} for an RF output power of $P_o = 10\text{dBm}$ (10mW) is:

$$R_{LC} = \frac{3^2}{2 * 0.01} = 450 \, \Omega$$

“Critical” operation is characterized by the RF peak voltage swing at the collector of the PA transistor to just reach the supply voltage V_S .

The high degree of efficiency under “critical” operating conditions can be explained by the low power losses at the transistor. During the conducting phase of the transistor, its collector voltage is very small. This way the power loss of the transistor, equal to $i_C * u_{CE}$ is minimized. This is particularly true for small current flow angles of $\theta \ll \pi$.
