imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

GreenChip synchronous rectifier controller

Rev. 1 — 16 February 2017

Product data sheet COMPANY PUBLIC

1 General description

The TEA1998TS is a member of a new generation of Synchronous Rectifier (SR) controller ICs for switched mode power supplies with adaptive gate drive for maximum efficiency at any load.

The TEA1998TS is a dedicated controller IC for synchronous rectification on the secondary side of flyback converters. It incorporates the sensing stage and driver stage for driving the SR MOSFET, which is rectifying the output of the secondary transformer winding.

The TEA1998TS can generate its own supply voltage for battery charging applications with low output voltage or for applications with high-side rectification.

The TEA1998TS is fabricated in a Silicon-On-Insulator (SOI) process.

2 Features and benefits

2.1 Efficiency features

- Adaptive gate drive for maximum efficiency at any load
- Typical supply current in no-load operation below 250 μA

2.2 Application features

- Operates in an output voltage range between 10 V and 0 V
- Drain sense pin capable of handling input voltages up to 60 V
- · Self-supplying for operation with low output voltage
- · Self-supplying for high-side rectification without the use of an auxiliary winding
- · Operates with standard and logic level SR MOSFETs
- Supports USB BC, QuickCharge and smart charging applications
- TSOP6 package

2.3 Control features

- · Adaptive gate drive for fast turn-off at the end of conduction
- UnderVoltage LockOut (UVLO) with active gate pull-down

3 Applications

The TEA1998TS is intended for flyback power supplies. In such applications, it can drive the external synchronous rectifier MOSFET, which replaces the diode for the rectification of the voltage on the secondary winding of the transformer.

It can be used in all power supplies that require a high efficiency, like:

- Chargers
- Adapters
- Flyback power supplies with very low and/or variable output voltage

SOURCE	5	source sense input of SR MOSFET
DRAIN	6	drain sense input of SR MOSFET

8 Functional description

8.1 Introduction

The TEA1998TS is a controller IC for Synchronous Rectification (SR) in flyback applications. It can drive the external synchronous rectifier MOSFET for the rectification of the voltage on the secondary winding of the transformer. Figure 3 shows a typical configuration.

8.2 Start-up and UnderVoltage LockOut (UVLO; CAP and XV pins)

The capacitor on the CAP pin supplies the TEA1998TS. When the XV voltage < 4.7 V, the capacitor is charged via the DRAIN pin. When the XV voltage \geq 4.7 V, the capacitor is charged via the XV pin and an internal regulator. The regulator reduces the voltage difference between the XV and CAP pins to a level below 100 mV.

When the voltage on the CAP pin exceeds V_{start(CAP)} (3.7 V typical), the IC leaves the UVLO state and activates the synchronous rectifier circuitry. When the voltage drops below 3.6 V (typical), the UVLO state is reentered and the SR MOSFET gate driver output is actively kept low.

8.3 Drain sense (DRAIN pin)

The drain sense pin is an input pin capable of handling input voltages up to 60 V. At positive drain sense voltages, the gate driver is in off-mode with the gate driver pulled down (pin GATE). At negative drain sense voltages, the IC enables the Synchronous Rectification (SR) by sensing the drain source differential voltage.

8.4 Synchronous rectification (DRAIN and SOURCE pins)

The IC senses the voltage difference between the drain sense (DRAIN pin) and the source sense (SOURCE pin) connections. This drain source differential voltage of the SR MOSFET is used to drive the gate of the SR MOSFET.

When this absolute voltage difference is higher than $V_{act(drv)}$, the corresponding gate driver output turns on the external SR MOSFET. When the external SR MOSFET is switched on, the absolute voltage difference between the drain and the source sense connections drops to below $V_{act(drv)}$. The regulation phase follows the turn-on phase.

In the regulation phase, the IC regulates the difference between the drain and the source sense inputs to an absolute level of 25 mV. When the absolute difference exceeds 25 mV ($V_{reg(drv)}$), the gate driver output increases the gate voltage of the external SR MOSFET until the 25 mV level is reached. The SR MOSFET does not switch off at low current. To avoid that the device switches off because of ringing, a minimum on-time of 1.4 µs ($t_{tact(sr)}_{(min)}$) is integrated.

When the absolute difference < 20 mV, the gate driver output decreases the gate voltage of the external SR MOSFET. The voltage waveform on the gate of the SR MOSFET follows the waveform of the current through the SR MOSFET. When the current through the SR MOSFET reaches zero, the SR MOSFET is switched off quickly.

After SR MOSFET switch-off, the drain voltage increases. When the drain voltage exceeds 250 mV, a low ohmic gate pull-down of 3 Ω keeps the gate of the SR MOSFET switched off.

8.5 Gate driver (GATE pin)

The gate driver circuit charges the gate of the external SR MOSFET during the rising part of the current. The driver circuit discharges the gate during the falling part of the current. The gate driver has a source capability of typically 0.70 A. It has a sink capability of typically 0.50 A. The source and sink capabilities allow fast turn-on and fast turn-off of the external SR MOSFET.

The maximum output voltage of the driver is limited to the voltage on the CAP pin. The maximum output voltage ranges between 4.7 V and 10 V, depending on the voltage on the CAP pin. The high output gate voltage drives all MOSFET brands to the minimum onstate resistance. In applications where the IC is supplied with 5 V, the maximum output voltage of the driver is 4.90 V and logic level SR MOSFETs can be used.

The IC is self-supplying in applications with high-side rectification or in battery charging applications with an output voltage < 4.7 V. When the XV pin is connected to ground for driving standard SR MOSFETs, the driver is regulated to 10 V. When the XV pin is connected to the converter output for driving logic-level SR MOSFETs, the driver is regulated to the voltage on the XV pin with a minimum of 4.7 V.

GreenChip synchronous rectifier controller

During start-up conditions ($V_{CAP} < V_{start(CAP)}$) and UVLO, the driver output voltage is actively pulled low.

8.6 Source sense (SOURCE pin)

The IC is equipped with an additional source sense pin (SOURCE). This pin is used for measuring the drain-to-source voltage of the external SR MOSFET. Voltage differences on PCB tracks because of parasitic inductance in combination with large dl/dt values, can cause errors. To minimize these errors, the source sense input must be connected as close as possible to the SOURCE pin of the external SR MOSFET.

12 Application information

A flyback switched mode power supply with the TEA1998TS consists of a primary side controller with a primary switch, a transformer, and an output stage. To obtain low conduction loss rectification, an SR MOSFET is used in the output stage. The SR MOSFET can be placed low-side (see Figure 3) or can be placed high-side (see Figure 9). In the high-side application, the TEA1998TS is self-supplying. The capacitor on the CAP pin supplies the TEA1998TS. When the drain voltage is positive, it is charged via the DRAIN pin.

The gate drive voltage for the synchronous rectifier switch is derived from the voltage difference between the corresponding drain sense and source sense pins.

Special attention must be paid to the connection of the drain sense and source sense pins. The voltages measured on these pins are used for the gate drive voltage. Wrong measurement results in a less efficient gate drive because a gate voltage that is either too low or too high. The connections to these pins must not interfere with the power wiring.

The power wiring conducts currents with high dl/dt values. It can easily cause measurement errors resulting from induced voltages due to parasitic inductances. The separate source sense pins make it possible to sense the source voltage of the external MOSFETs directly, without having to use the current carrying power ground tracks.

The term 'short data sheet' is explained in section "Definitions".

[2] [3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

15.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for guick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

15.3 Disclaimers

Limited warranty and liability - Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors

Right to make changes - NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use - NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale - NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license - Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.
