mail

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

High Accuracy Low Dropout Voltage Tracking Regulator

TLE4254

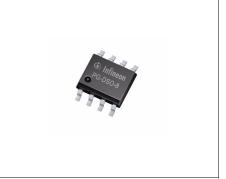

1 Overview

Features

- 70 mA output current capability
- Very tight output tracking tolerance to reference
- Output voltage adjustable down to 2.0 V
- Stable operation with 1 µF ceramic output capacitor
- Flexibility of output voltage adjust higher or lower than reference, proportional to the reference voltage (version GA / EJ A)
- Status output to indicate short circuits at the output (version GS / EJ S)
- Very low dropout voltage of typ. 0.2 V @ maximum output current
- Combined reference / enable input
- Very low current consumption in OFF mode
- Wide input voltage range -20 V $\leq V_1 \leq$ +45 V
- Wide temperature range: -40 °C $\leq T_i \leq$ 150 °C
- · Output protected against short circuit to GND and battery
- Input protected against reverse polarity
- Overtemperature protection
- Green product (RoHS compliant)
- AEC qualified

Functional Description

PG-DSO-8

PG-DSO-8 exposed pad

The TLE4254 is a monolithic integrated low-dropout voltage tracking regulator with high accuracy in small PG-DSO-8 packages. The IC is designed to supply off-board systems, e. g. sensors in powertrain management systems under the severe conditions of automotive applications. Therefore, the IC is equipped with additional protection functions against reverese polarity and short circuit to GND and battery.

With supply voltages up to 40 V, the output voltage follows a reference voltage applied at the adjust input with very high accuracy. The reference voltage applied directly to the adjust input or by an e. g. external resistor divider can be 2.0 V at minimum.

The output is able to drive loads up to 70 mA while the device follows with high accuracy the e. g. 5 V output of a main voltage regulator acting as reference.

| Туре | Package | Marking |
|-------------|----------------------|---------|
| TLE4254GA | PG-DSO-8 | 4254GA |
| TLE4254GS | PG-DSO-8 | 4254GS |
| TLE4254EJ A | PG-DSO-8 exposed pad | 4254EJA |
| TLE4254EJ S | PG-DSO-8 exposed pad | 4254EJS |

Overview

The TLE4254 can be set into shutdown mode in order to reduce the current consumption to a minimum. This suits the IC for low power battery applications.

Versions "GS" and "EJ S" offer an open collector status output indicating an overvoltage and undervoltage error condition of the output voltage.

Versions "GA" and "EJ A" allow setting the output voltage to higher value than the reference voltage by connecting a voltage divider to the feedback pin "FB".

Pin Definitions and Functions

3 Pin Definitions and Functions

3.1 Pin Assignment TLE4254GA and TLE4254GS

3.2 Pin Functions TLE4254GA and TLE4254GS

| Pin | Symbol | Function |
|---------------|--------------------|---|
| 1 | Q | Tracker Output. Block to GND with a capacitor close to the IC terminals, respecting capacitance and ESR requirements given in the table "Functional Range". |
| 2, 3, 6, 7 | GND | Ground reference. Interconnect the pins on PCB. Connect to heatsink area. |
| 4 | FB (version GA) | Feedback input (version GA only). Non inverting input of the internal error amplifier to control the output voltage. Connect this pin directly to the output pin in order to obtain lower or equal output voltages with respect to the reference voltage. Connect a voltage divider for higher output voltages than the reference. (See also application information.) |
| 4 | ST (version GS) | Tracking Regulator Status Output (version GS only). Open collector output. Connect via a pull-up resistor to a positive voltage rail. A low signal indicates fault condions at the regulator's output. |
| 5 | EN/ADJ | Adjust / Enable. Connect the reference to this pin. The active high signal of the reference turns on the device; a low signal disables the IC. The reference voltage can be connected directly or by a voltage divider for lower output voltages (see application information). |
| 8 | 1 | Input. IC supply. For compensating line influences, a capacitor close to the IC terminals is recommended. |

| ESD Ra | ating | | | | | |
| 4.1.8 | ESD Susceptibility | $ V_{\rm ESD,HBM} $ | 4 | - | kV | HBM ²⁾ |
| 4.1.9 | | $ V_{\rm ESD,CDM} $ | 1 | _ | kV | CDM ³⁾ |

1) Not subject to production test, specified by design.

2) ESD susceptibility Human Body Model "HBM" according to AEC-Q100-002 - JESD22-A114

3) ESD susceptibility Charged Device Model "CDM" according to ESDA STM5.3.1

Note: Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

General Product Characteristics

4.2 Functional Range

| Pos. | Parameter | Symbol | Limi | t Values | Unit | Conditions |

| 4.3.8 | | | _ | 60 | - | K/W | 600 mm ² PCB heatsink area ^{2) 1)} |

1) Not subject to production test; specified by design.

2) Package mounted on PCB FR4; 80 x 80 x 1.5 mm; 35 µm Cu, 5 µm Sn; horizontal position; zero airflow.

3) Specified R_{thJA} value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; The Product (Chip+Package) was simulated on a 76.2 x 114.3 x 1.5 mm³ board with 2 inner copper layers (2 x 70µm Cu, 2 x 35µm Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer.

Electrical Characteristics

5 Electrical Characteristics

5.1 Tracking Regulator

The output voltage $V_{\rm Q}$ is controlled by comparing it to the voltage applied at pin ADJ/EN and driving a PNP pass transistor accordingly. The control loop stability depends on the output capacitor $C_{\rm Q}$, the load current, the chip temperature and the poles/zeros introduced by the integrated circuit and the load. To ensure stable operation, the output capacitor's capacitance and its equivalent series resistor ESR requirements given in the table "Functional Range" have to be maintained. For details see also the typical performance graph "Output Capacitor Series Resistor $ESR_{\rm CQ}$ vs. Output Current $I_{\rm Q}$ ". Also, the output capacitor shall be sized to buffer load transients.

An input capacitor C_1 is strongly recommended to buffer line influences. Connect the capacitors close to the IC terminals.

Protection circuitry prevent the IC as well as the application from destruction in case of catastrophic events. These safeguards contain output current limitation, reverse polarity protection as well as thermal shutdown in case of overtemperature.

In order to avoid excessive power dissipation that could never be handled by the pass element and the package, the maximum output current is decreased at high input voltages.

The overtemperature protection circuit prevents the IC from immediate destruction under fault conditions (e. g. output continuously short-circuited) by reducing the output current. A thermal balance below 200 °C junction temperature is established. Please note that a junction temperature above 150 °C is outside the maximum ratings and reduces the IC lifetime.

The TLE4254 allows a negative supply voltage. However, several small currents are flowing into the IC increasing its junction temperature. This has to be considered for the thermal design, respecting that the thermal protection circuit is not operating during reverse polarity condition.

Table 1 Electrical Characteristics Tracking Regulator

 $V_{\rm I}$ = 13.5 V; $V_{\rm ADJ/EN} \ge 2.0$ V; $V_{\rm FB}$ = $V_{\rm Q}$ (version GA / EJ A); -40 °C $\le T_{\rm j} \le 150$ °C; $C_{\rm Q}$ = 1 µF; all voltages with respect to ground (unless otherwise specified).

Typical Performance Characteristics Current Consumption

5.3 Adjust / Enable Input

In order to reduce the quiescent current to a minumum, the TLE4254 can be switched to stand-by mode by setting the adjust/enable input "ADJ/EN" to "low".

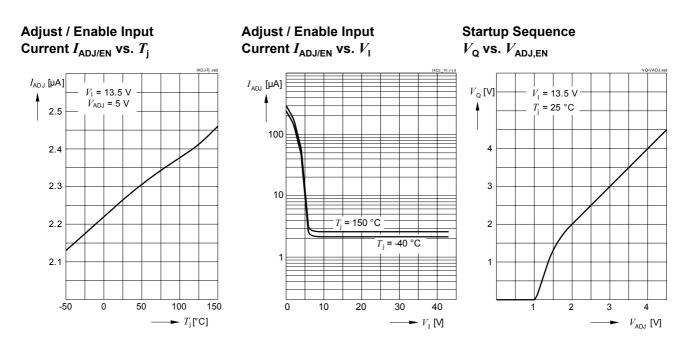

In case the pin "ADJ/EN is left open, an internal pull-down resistors keeps the voltage at the pin low and therefore ensures that the regulator is switched off.

Table 3 Electrical Characteristics Adjust / Enable

 $V_{\rm I}$ = 13.5 V; $V_{\rm ADJ/EN} \ge 2.0$ V; $V_{\rm FB}$ = $V_{\rm Q}$ (version GA / EJ A); -40 °C $\le T_{\rm j} \le$ 150 °C; $C_{\rm Q}$ = 1 µF all voltages with respect to ground (unless otherwise specified).

Typical Performance Characteristics Adjust / Enable Input

5.4 Status Output (version GS / EJ S only)

The status output ST indicates an overvoltage or undervoltage situation at the regulator's output Q. Therefore, the output voltage $V_{\rm Q}$ is compared to the reference voltage $V_{\rm ADJ/EN}$. Variations of the output voltage are indicated by a low signal at the status output ST. Transients shorter than the status reaction time $t_{\rm ST,r}$ will not trigger the status output.

The status output ST is an open collector output, requiring a pull-up resisitor to a positive voltage rail.

Table 4 Electrical Characteristics Status Output ST (Version GS / EJ S only)

 $V_{\rm I}$ = 13.5 V; $V_{\rm ADJ/EN} \ge$ 2.0 V; -40 °C $\le T_{\rm j} \le$ 150 °C; $C_{\rm Q}$ = 1 µF all voltages with respect to ground (unless otherwise specified).

| Pos. | Parameter | Symbol | Limit Values | | | Unit | Test Condition |

TLE4254

Application Information

6 Application Information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device. The application circuits shown are simplified examples. The function must be verified in the real application.

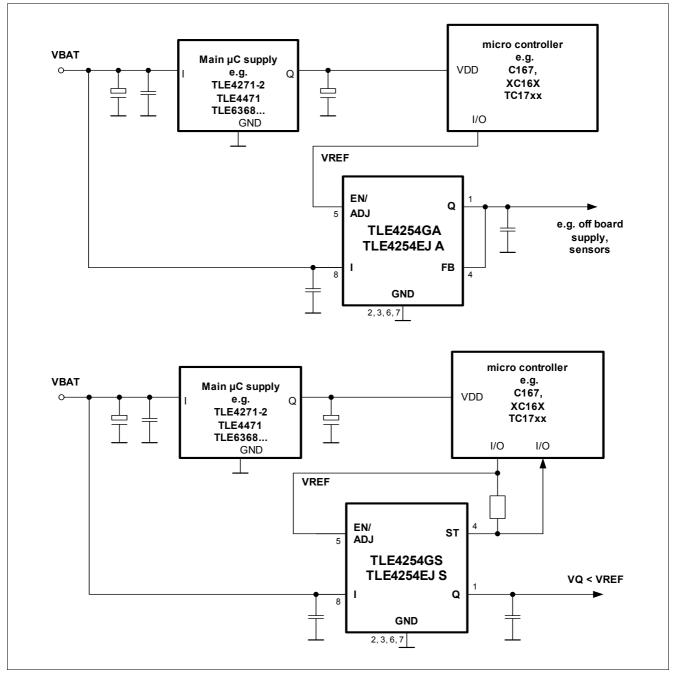

Figure 5 Application circuit: Output voltage V_{Q} equal to reference voltage $V_{ADJ/EN}$

Figure 5 shows a typical schematic for applications where the tracker output voltage V_Q equals the reference voltage V_{REF} applied to the pin "EN/ADJ". At version GA / EJ A, the pin FB is directly connected to the output "Q". The reference voltage is directly applied to "EN/ADJ".

Application Information

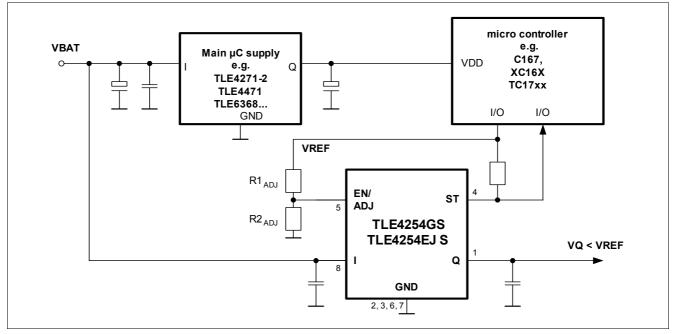

Figure 6 Application circuit: Output voltage V_{Q} lower than reference voltage V_{REF} Status Output feedbacked to microcontroller (version GS / EJ S)

٦

In order to obtain a lower output voltage V_{Q} at the tracker output than the reference voltage V_{REF} , a voltage divider according to Application circuit: Output voltage VQ lower than reference voltage VREF Status Output feedbacked to microcontroller (version GS / EJ S) has to be used. The output voltage V_{Q} then calculates:

$$V_{\rm Q} = V_{\rm REF} \cdot \left(\frac{R2_{\rm ADJ}}{R1_{\rm ADJ} + R2_{\rm ADJ}}\right)$$

With a given reference voltage V_{REF} , the desired output voltage V_{Q} and the resistor value RI_{ADJ} , the resistor value for $R2_{\text{ADJ}}$ is given by:

$$R2_{ADJ} = R1_{ADJ} \cdot \left(\frac{V_Q}{V_{REF} - V_Q}\right)$$

Taking into consideration also the effect of the internal EN/ADJ pull-down resistor, the external resistor divider's $R2_{ADJ}$ has to be selected to:

$$R2_{ADJ,select} = \left(\frac{R2_{ADJ} \cdot R_{PullDown,min}}{R_{PullDown,min} - R2_{ADJ}}\right)$$

Application Information

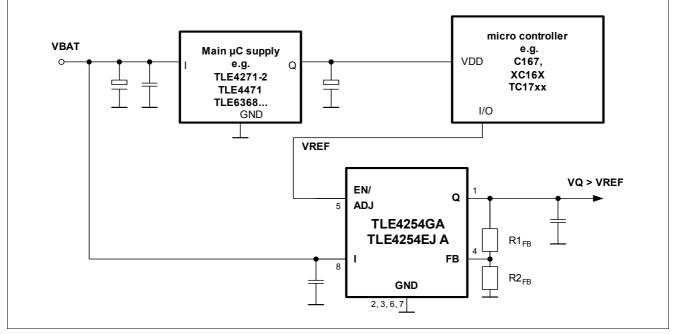

Figure 7 Application circuit: Output voltage V_{Q} higher than reference voltage V_{REF} (version GA / EJ A only)

For output voltages higher than the reference voltage, the voltage divider has to be applied between the feedback and the output according to **Application circuit: Output voltage VQ higher than reference voltage VREF** (version GA / EJ A only). The equation for the output voltage with respect to the reference voltage is given by:

$$V_{Q} = V_{REF} \cdot \left(\frac{R1_{FB} + R2_{FB}}{R2_{FB}}\right)$$

Keep in mind that the input voltage has to be at minimum equal to the output voltage plus the dropout voltage of the regulator.

With a given reference voltage V_{REF} , the desired output voltage V_{Q} and the resistor value RI_{FB} , the resistor value for $R2_{\text{FB}}$ is given by:

$$R2_{FB} = R1_{FB} \cdot \left(\frac{V_{REF}}{V_Q - V_{REF}}\right)$$

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

Legal Disclaimer

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics. With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

Information

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (www.infineon.com).

Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
