

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## 5-V Low Drop Fixed Voltage Regulator

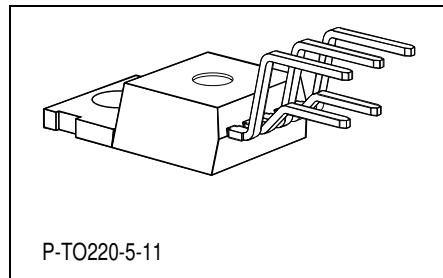

**TLE 4270**

### Features

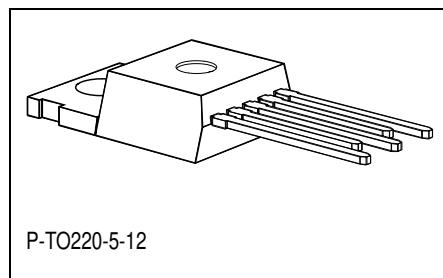

- Output voltage tolerance  $\leq \pm 2\%$
- 650 mA output current capability
- Low-drop voltage
- Reset functionality
- Adjustable reset time
- Suitable for use in automotive electronics
- Integrated overtemperature protection
- Reverse polarity protection
- Input voltage up to 42 V
- Overvoltage protection up to 65 V ( $\leq 400$  ms)
- Short-circuit proof
- Wide temperature range
- ESD protection  $> 4000$  V

### Functional Description

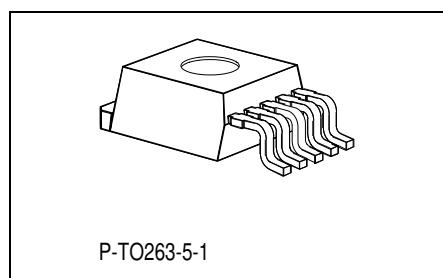

This device is a 5-V low drop fixed-voltage regulator. The maximum input voltage is 42 V (65 V,  $\leq 400$  ms). Up to an input voltage of 26 V and for an output current up to 650 mA it regulates the output voltage within a 2% accuracy. The short circuit protection limits the output current of more than 650 mA. The device incorporates overvoltage protection and a temperature protection which turns off the device at high temperatures.

**Figure 1** Pin Configuration (top view)

**Table 1** Pin Definitions and Functions

Pin	Symbol	Function
1	I	<b>Input</b> ; block to ground directly at the IC with a ceramic capacitor.
2	RO	<b>Reset Output</b> ; the open collector output is connected to the 5-V output via an integrated resistor of 30 kΩ.
3	GND	<b>Ground</b> ; internally connected to heatsink.
4	D	<b>Reset Delay</b> ; connect a capacitor to ground for delay time adjustment.
5	Q	<b>5-V Output</b> ; block to ground with 22 µF capacitor, ESR < 3 Ω.

## Circuit Description

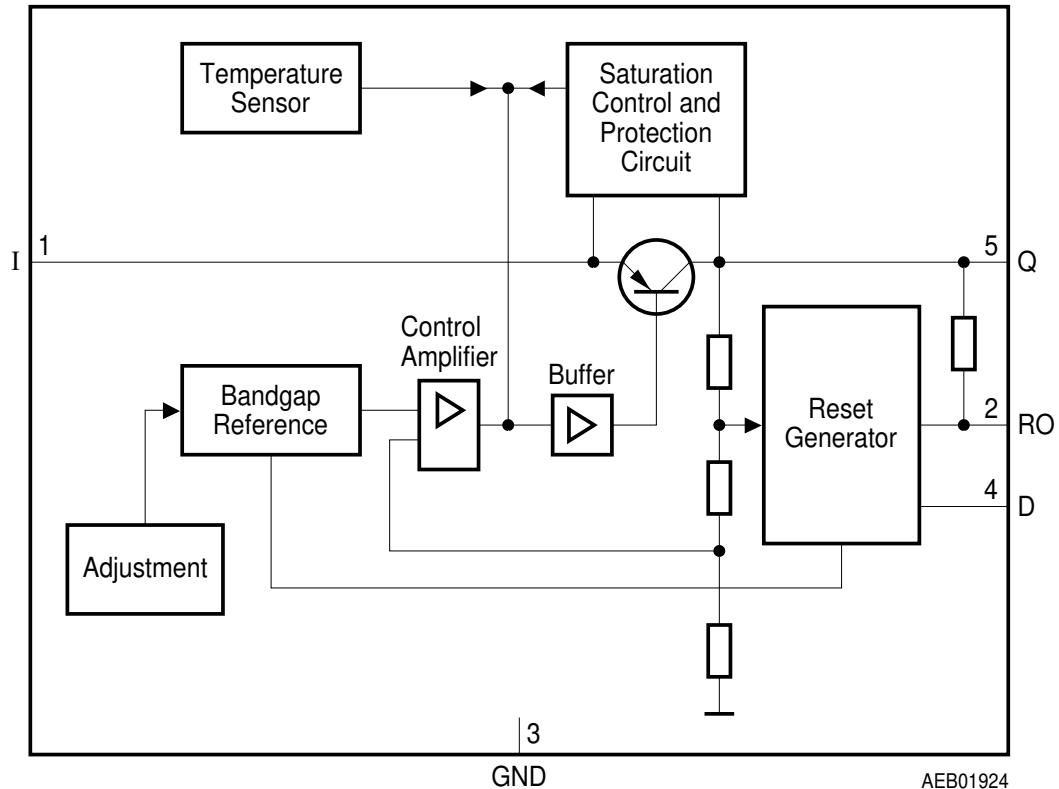

The control amplifier compares a reference voltage, which is kept highly accurate by resistance adjustment, to a voltage that is proportional to the output voltage and drives the base of a series transistor via a buffer. Saturation control as a function of the load current prevents any over-saturation of the power element.

The IC also incorporates a number of internal circuits for protection against:

- Overload
- Overvoltage
- Overtemperature
- Reverse polarity

## Application Description

The IC regulates an input voltage in the range of  $5.5 \text{ V} < V_I < 36 \text{ V}$  to  $V_{Q,\text{nom}} = 5.0 \text{ V}$ . Up to 26 V it produces a regulated output current of more than 650 mA. Above 26 V the save-operating-area protection allows operation up to 36 V with a regulated output current of more than 300 mA. Overvoltage protection limits operation at 42 V. The overvoltage protection hysteresis restores operation if the input voltage has dropped below 36 V. A reset signal is generated for an output voltage of  $V_Q < 4.5 \text{ V}$ . The delay for power-on reset can be set externally with a capacitor.

### Overvoltage Protection

Turn-Off voltage	$V_{I, ov}$	42	44	46	V	—
------------------	-------------	----	----	----	---	---

- 1) Drop voltage =  $V_I - V_Q$  (measured when the output voltage has dropped 100 mV from the nominal value obtained at 13.5 V input)
- 2) Reset peak is always lower than 1.0 V.

**Figure 3      Test Circuit**

## Design Notes for External Components

An input capacitor  $C_I$  is necessary for compensation of line influences. The resonant circuit consisting of lead inductance and input capacitance can be damped by a resistor of approx.  $1\ \Omega$  in series with  $C_I$ . An output capacitor  $C_Q$  is necessary for the stability of the regulating circuit. Stability is guaranteed at values of  $C_Q \geq 22\ \mu\text{F}$  and an ESR of  $< 3\ \Omega$ .

## Reset Circuitry

If the output voltage decreases below 4.5 V, an external capacitor  $C_D$  on pin 4 (D) will be discharged by the reset generator. If the voltage on this capacitor drops below  $V_{DL}$ , a reset signal is generated on pin 2 (RO), i.e. reset output is set low. If the output voltage rises above the reset threshold,  $C_D$  will be charged with constant current. After the power-on-reset time the voltage on the capacitor reaches  $V_{DU}$  and the reset output will be set high again. The value of the power-on-reset time can be set within a wide range depending of the capacitance of  $C_D$ .

## Reset Timing

The power-on reset delay time is defined by the charging time of an external capacitor  $C_D$  which can be calculated as follows:

$$C_D = (\Delta t \times I_{D,c})/\Delta V \quad (1)$$

Definitions:

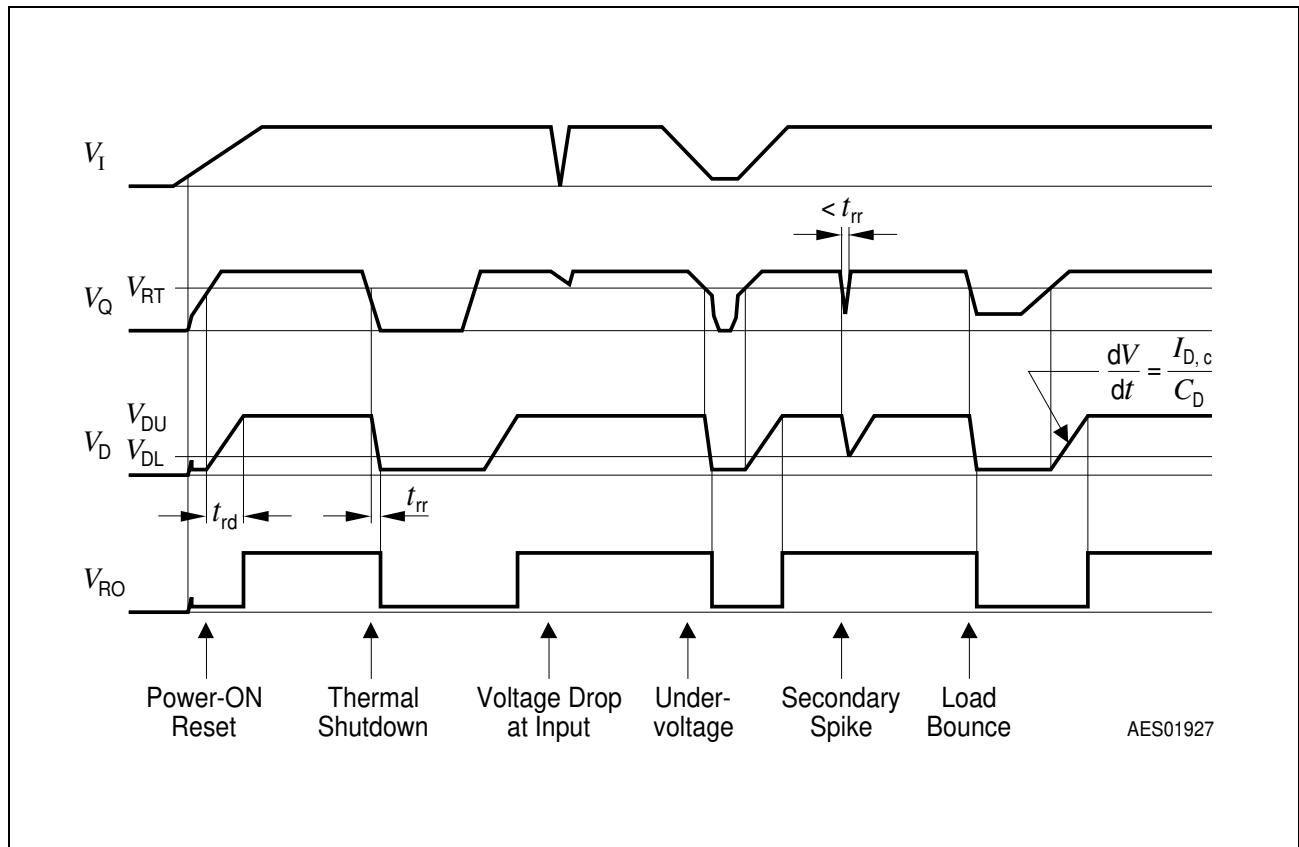

- $C_D$  = delay capacitors
- $\Delta t$  = reset delay time  $t_{rd}$
- $I_{D,c}$  = charge current, typical  $14\ \mu\text{A}$
- $\Delta V = V_{DU}$ , typical  $1.8\ \text{V}$

$V_{DU}$  = upper reset timing threshold at  $C_D$  for reset delay time

$$t_{rd} = \Delta V \times C_D / I_{D,c} \quad (2)$$

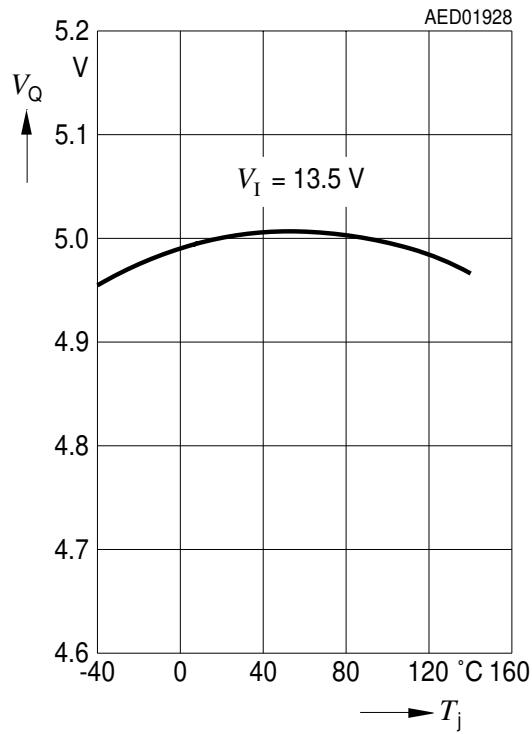

The reset reaction time  $t_{rr}$  is the time it takes the voltage regulator to set the reset out LOW after the output voltage has dropped below the reset threshold. It is typically  $1\ \mu\text{s}$  for delay capacitor of  $47\ \text{nF}$ . For other values for  $C_D$  the reaction time can be estimated using the following equation:

$$t_{rr} \approx 20\ \text{s/F} \times C_D \quad (3)$$
