**Description**

The TS13001 is a galvanic isolated 56V power switch device with bi-directional blocking. The device includes a single integrated 110mOhm high voltage FET allowing high efficiency switching of power loads or other high current applications. The input pin, CLK, controls the turn on/off of the switch.

The TS13001 includes several protection features. Each FET has an integrated over-current shut-down to prevent device damage during short-circuit or other unusually high load conditions. If an over-current event is detected for a time the FET is latched off until the CLK pin is held off and turned on again. While the CLK pin is active after an over-current event or in the event of an incorrect turn-on sequence, the DATA pin is toggled at ¼ the CLK frequency.

**Applications**

- Power load/rail switching
- Input supply muxing
- Isolated power supplies
- Solid state relays
- HVAC control

**Typical Application Circuit**
