Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

TS4890

RAIL TO RAIL OUTPUT **1W** AUDIO POWER AMPLIFIER WITH STANDBY MODE ACTIVE LOW

- OPERATING FROM V_{CC} **= 2.2V to 5.5V**
- **1W** RAI L TO RAIL OUTPUT POWER @ Vcc=5V, THD=1%, f=1kHz, with **8**Ω Load
- ULTRA LOW CONSUMPTION IN STANDBY MODE **(10nA)**
- **75dB** PSRR @ 217Hz from 5 to 2.2V
- POP & CLICK REDUCTION CIRCUITRY
- ULTRA LOW DISTORTION **(0.1%)**
- UNITY GAIN STABLE
- AVAILABLE IN **SO8, MiniSO8 & DFN8**

DESCRIPTION

The TS4890 (MiniSO8 & SO8) is an Audio Power Amplifier capable of delivering 1W of continuous RMS. ouput power into 8Ω load @ 5V.

This Audio Amplifier is exhibiting 0.1% distortion level (THD) from a 5V supply for a Pout = 250mW RMS. An external standby mode control reduces the supply current to less than 10nA. An internal thermal shutdown protection is also provided.

The TS4890 have been designed for high quality audio applications such as mobile phones and to minimize the number of external components.

The unity-gain stable amplifier can be configured by external gain setting resistors.

APPLICATIONS

- Mobile Phones (Cellular / Cordless)
- Laptop / Notebook Computers
- PDAs
- Portable Audio Devices

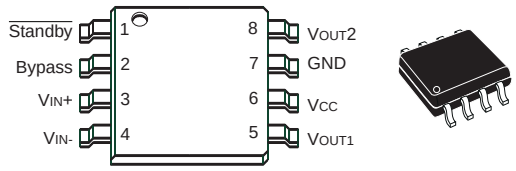
ORDER CODE

Part Number	Temperature Range	Package			Marking
		S	D	Q	
TS4890	-40, +85°C	•			4890I
			•		4890
				•	4890

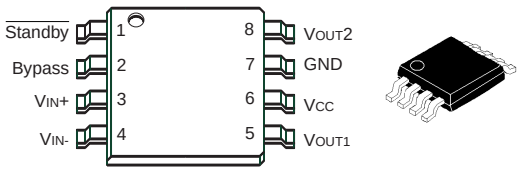
MiniSO & DFN only available in Tape & Reel: with T suffix.
SO is available in Tube (D) and of Tape & Reel (DT)

PIN CONNECTIONS (Top View)

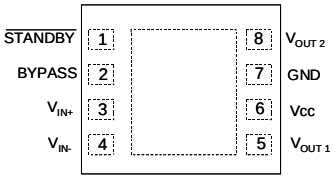
TS4890ID, TS4890IDT - SO8



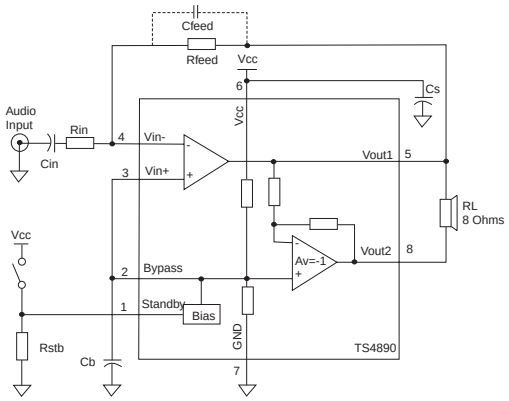
TS4890IST - MiniSO8



TS4890IQT - DFN8



TYPICAL APPLICATION SCHEMATIC



ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage [1]	6	V
V_i	Input Voltage [2]	G_{ND} to V_{CC}	V
T_{oper}	Operating Free Air Temperature Range	-40 to + 85	°C
T_{stg}	Storage Temperature	-65 to +150	°C
T_j	Maximum Junction Temperature	150	°C
R_{thja}	Thermal Resistance Junction to Ambient[3] SO8 MiniSO8 DFN8	 175 215 70	°C/W
Pd	Power Dissipation[4]	See Power Derating Curves Fig. 24	W
ESD	Human Body Model	2	kV
ESD	Machine Model	200	V
	Latch-up Immunity	Class A	
	Lead Temperature (soldering, 10sec)	260	°C

1. All voltages values are measured with respect to the ground pin.
2. The magnitude of input signal must never exceed V_{CC} + 0.3V / G_{ND} - 0.3V
3. Device is protected in case of over temperature by a thermal shutdown active @ 150°C.
4. Exceeding the power derating curves during a long period may involve abnormal working of the device.

OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage	2.2 to 5.5	V
V_{ICM}	Common Mode Input Voltage Range	G_{ND} + 1V to V_{CC}	V
V_{STB}	Standby Voltage Input : Device ON Device OFF	 $1.5 \leq V_{STB} \leq V_{CC}$ $G_{ND} \leq V_{STB} \leq 0.5$	V
R_L	Load Resistor	4 - 32	Ω
R_{thja}	Thermal Resistance Junction to Ambient[1] SO8 MiniSO8 DFN8 [2]	 150 190 41	°C/W

1. This thermal resistance can be reduced with a suitable PCB layout (see Power Derating Curves Fig. 24)
2. When mounted on a 4 layers PCB

ELECTRICAL CHARACTERISTICS

V_{CC} = **+5V**, GND = **0V**, T_{amb} = 25°C (unless otherwise specified)

Symbol	Parameter	Min.	Typ.	Max.	Unit
I_{CC}	Supply Current No input signal, no load		6	8	mA
$I_{STANDBY}$	Standby Current [1] No input signal, Vstdby = G_{ND}, RL = 8Ω		10	1000	nA
Voo	Output Offset Voltage No input signal, RL = 8Ω		5	20	mV
Po	Output Power THD = 1% Max, f = 1kHz, RL = 8Ω		1		W
THD + N	Total Harmonic Distortion + Noise Po = 250mW rms, Gv = 2, 20Hz < f < 20kHz, RL = 8Ω		0.15		%
PSRR	Power Supply Rejection Ratio[2] f = 217Hz, RL = 8Ω, RFeed = 22KΩ, Vripple = 200mV rms		77		dB
Φ_M	Phase Margin at Unity Gain R_L = 8Ω, C_L = 500pF		70		Degrees
GM	Gain Margin R_L = 8Ω, C_L = 500pF		20		dB
GBP	Gain Bandwidth Product R_L = 8Ω		2		MHz

1. Standby mode is actived when Vstdby is tied to GND
2. Dynamic measurements - 20*log(rms(Vout)/rms(Vripple)). Vripple is the surimposed sinus signal to Vcc @ f = 217Hz

V_{CC} = **+3.3V**, GND = **0V**, T_{amb} = 25°C (unless otherwise specified)

Symbol	Parameter	Min.	Typ.	Max.	Unit
I_{CC}	Supply Current No input signal, no load		5.5	8	mA
$I_{STANDBY}$	Standby Current [1] No input signal, Vstdby = G_{ND}, RL = 8Ω		10	1000	nA
Voo	Output Offset Voltage No input signal, RL = 8Ω		5	20	mV
Po	Output Power THD = 1% Max, f = 1kHz, RL = 8Ω		450		mW
THD + N	Total Harmonic Distortion + Noise Po = 250mW rms, Gv = 2, 20Hz < f < 20kHz, RL = 8Ω		0.15		%
PSRR	Power Supply Rejection Ratio[2] f = 217Hz, RL = 8Ω, RFeed = 22KΩ, Vripple = 200mV rms		77		dB
Φ_M	Phase Margin at Unity Gain R_L = 8Ω, C_L = 500pF		70		Degrees
GM	Gain Margin R_L = 8Ω, C_L = 500pF		20		dB
GBP	Gain Bandwidth Product R_L = 8Ω		2		MHz

1. Standby mode is actived when Vstdby is tied to GND
2. Dynamic measurements - 20*log(rms(Vout)/rms(Vripple)). Vripple is the surimposed sinus signal to Vcc @ f = 217Hz

V_{CC} = **2.6V**, GND = **0V**, T_{amb} = 25°C (unless otherwise specified)

Symbol	Parameter	Min.	Typ.	Max.	Unit
I_{CC}	Supply Current No input signal, no load		5	8	mA
$I_{STANDBY}$	Standby Current [1] No input signal, Vstdby = G_{ND}, RL = 8Ω		10	1000	nA
Voo	Output Offset Voltage No input signal, RL = 8Ω		5	20	mV
Po	Output Power THD = 1% Max, f = 1kHz, RL = 8Ω		260		mW
THD + N	Total Harmonic Distortion + Noise Po = 200mW rms, Gv = 2, 20Hz < f < 20kHz, RL = 8Ω		0.15		%

GBP	Gain Bandwidth Product R_L = 8Ω		2		MHz

1. Standby mode is actived when Vstdby is tied to GND
2. Dynamic measurements - 20*log(rms(Vout)/rms(Vripple)). Vripple is the surimposed sinus signal to Vcc @ f = 217Hz

Components	Functional Description
Rin	Inverting input resistor which sets the closed loop gain in conjunction with Rfeed. This resistor also forms a high pass filter with Cin (fc = 1 / (2 x Pi x Rin x Cin))
Cin	Input coupling capacitor which blocks the DC voltage at the amplifier input terminal
Rfeed	Feed back resistor which sets the closed loop gain in conjunction with Rin
Cs	Supply Bypass capacitor which provides power supply filtering
Cb	Bypass pin capacitor which provides half supply filtering
Cfeed	Low pass filter capacitor allowing to cut the high frequency (low pass filter cut-off frequency 1 / (2 x Pi x Rfeed x Cfeed))
Rstb	Pull-down resistor which fixes the right supply level on the standby pin
Gv	Closed loop gain in BTL configuration = 2 x (Rfeed / Rin)

REMARKS

1. All measurements, except PSRR measurements, are made with a supply bypass capacitor Cs = 100µF.

1. External resistors are not needed for having better stability when supply @ Vcc down to 3V. The quiescent current still remains the same.

2. The standby response time is about 1µs.

■ BTL Configuration Principle

The TS4890 is a monolithic power amplifier with a BTL output type. BTL (Bridge Tied Load) means that each end of the load are connected to two single ended output amplifiers. Thus, we have :

Single ended output 1 = Vout1 = Vout (V)
Single ended output 2 = Vout2 = -Vout (V)

And Vout1 - Vout2 = 2Vout (V)

The output power is :

$$Pout = \frac{(2\,Vout_{RMS})^2}{R_L} \text{ (W)}$$

For the same power supply voltage, the output power in BTL configuration is four times higher than the output power in single ended configuration.

■ Gain In Typical Application Schematic (cf. page 1)

In flat region (no effect of Cin), the output voltage of the first stage is :

$$Vout1 = -Vin\frac{Rfeed}{Rin} \text{ (V)}$$

For the second stage : Vout2 = -Vout1 (V)

The differential output voltage is

$$Vout2 - Vout1 = 2Vin\frac{Rfeed}{Rin} \text{ (V)}$$

The differential gain named gain (Gv) for more convenient usage is :

$$Gv = \frac{Vout2 - Vout1}{Vin} = 2\frac{Rfeed}{Rin}$$

Remark : Vout2 is in phase with Vin and Vout1 is 180 phased with Vin. It means that the positive terminal of the loudspeaker should be connected to Vout2 and the negative to Vout1.

■ Low and high frequency response

In low frequency region, the effect of Cin starts. Cin with Rin forms a high pass filter with a -3dB cut off frequency .

$$F_{CL} = \frac{1}{2\pi RinCin} \text{ (Hz)}$$

In high frequency region, you can limit the bandwidth by adding a capacitor (Cfeed) in parallel on Rfeed. Its form a low pass filter with a -3dB cut off frequency .

$$F_{CH} = \frac{1}{2\pi\, Rfeed\, Cfeed} \text{ (Hz)}$$

■ Power dissipation and efficiency

Hypothesis :

• Voltage and current in the load are sinusoidal (Vout and Iout)
• Supply voltage is a pure DC source (Vcc)

Regarding the load we have :

$$V_{OUT} = V_{PEAK} \sin\omega t \text{ (V)}$$

and

$$I_{OUT} = \frac{V_{OUT}}{R_L} \text{ (A)}$$

and

$$P_{OUT} = \frac{V_{PEAK}^2}{2R_L} \text{ (W)}$$

Then, the average current delivered by the supply voltage is

$$Icc_{AVG} = 2\frac{V_{PEAK}}{\pi R_L} \text{ (A)}$$

The power delivered by the supply voltage is Psupply = Vcc Icc_{AVG} (W)

Then, the **power dissipated by the amplifier** is Pdiss = Psupply - Pout (W)

$$Pdiss = \frac{2\sqrt{2}\,Vcc}{\pi\sqrt{R_L}}\sqrt{P_{OUT}} - P_{OUT} \text{ (W)}$$

and the maximum value is obtained when

$$\frac{\partial Pdiss}{\partial P_{OUT}} = 0$$

and its value is

$$Pdiss\,max = \frac{2Vcc^2}{\pi^2 R_L} \text{ (W)}$$

Remark : This maximum value is only depending on power supply voltage and load values.

The **efficiency** is the ratio between the output power and the power supply

$$\eta = \frac{P_{OUT}}{P\,supply} = \frac{\pi V_{PEAK}}{4\,Vcc}$$

The maximum theoretical value is reached when Vpeak = Vcc, so

$$\frac{\pi}{4} = 78.5\%$$

■ Decoupling of the circuit

Two capacitors are needed to bypass properly the TS4890. A power supply bypass capacitor Cs and a bias voltage bypass capacitor Cb.

Cs has especially an influence on the THD+N in high frequency (above 7kHz) and indirectly on the power supply disturbances.
With 100µF, you can expect similar THD+N performances like shown in the datasheet.

If Cs is lower than 100µF, in high frequency increase THD+N and disturbances on the power supply rail are less filtered.
To the contrary, if Cs is higher than 100µF, those disturbances on the power supply rail are more filtered.

Cb has an influence on THD+N in lower frequency, but its function is critical on the final result of PSRR with input grounded in lower frequency.

If Cb is lower than 1µF, THD+N increase in lower frequency (see THD+N vs frequency curves) and the PSRR worsens up
If Cb is higher than 1µF, the benefit on THD+N in lower frequency is small but the benefit on PSRR is substantial (see PSRR vs. Cb curves).

Note that Cin has a non-negligible effect on PSRR in lower frequency. Lower is its value, higher is the PSRR (see fig. 13).

■ Pop and Click performance

In order to have the best performances with the pop and click circuitry, the formula below must be follow :

$$\tau_{in} \leq \tau_b$$

With

$$\tau_{in} = (R_{in} + R_{feed}) \times C_{in} \text{ (s)}$$

and

$$\tau_b = 50k\Omega \times C_b \text{ (s)}$$
