

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Dual mode low power 150 mW stereo headphone amplifier with capacitor-less and single-ended outputs

Datasheet – production data

### Features

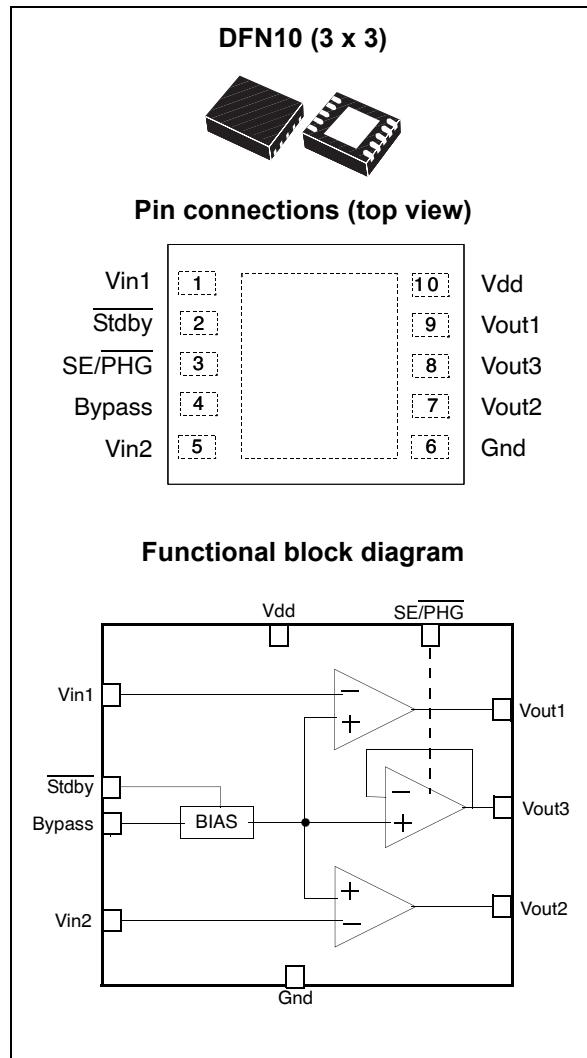

- No output coupling capacitors necessary
- Pop-and-click noise reduction circuitry
- Operating from  $V_{CC}$  = 2.2 V to 5.5 V
- Standby mode active low
- Output power:
  - 158 mW at 5 V, into 16 Ω with 1% THD+N max (1 kHz)
  - 52 mW at 3.0 V into 16 Ω with 1% THD+N max (1 kHz)
- Ultra-low current consumption: 2.0 mA typ. at 3 V
- Ultra-low standby consumption: 10 nA typ.
- High signal-to-noise ratio: 105 dB typ. at 5 V
- High crosstalk immunity: 110 dB ( $F = 1$  kHz) for single-ended outputs
- PSRR: 72 dB ( $F = 1$  kHz), inputs grounded, for phantom ground outputs
- Low  $t_{WU}$ : 50 ms in PG mode, 100 ms in SE mode
- Available in lead-free DFN10 3 x 3 mm

### Applications

- Headphone amplifier
- Mobile phone
- PDA, portable audio player

### Description

The TS4909 is a stereo audio amplifier designed to drive headphones in portable applications. The integrated phantom ground is a circuit topology that eliminates the heavy output coupling capacitors. This is of primary importance in portable applications where space constraints are very high. A single-ended configuration is also available, offering even lower power consumption because the phantom ground can be switched off. Pop-and-click noise during switch-on and switch-off phases is eliminated by integrated circuitry.

Specially designed for applications requiring low power supplies, the TS4909 is capable of delivering 31 mW of continuous average power into a 32 Ω load with less than 1% THD+N from a 3 V power supply. Featuring an active low standby mode, the TS4909 reduces the supply current to only 10 nA (typ.). The TS4909 is unity gain stable and can be configured by external gain-setting resistors.

# 1 Typical application schematics

**Figure 1.** Typical applications for the TS4909

**Table 1.** Application component information

Component	Functional description
$R_{in1,2}$	Inverting input resistor that sets the closed loop gain in conjunction with $R_{feed}$ . This resistor also forms a high pass filter with $C_{in}$ ( $f_c = 1 / (2 \times \pi \times R_{in} \times C_{in})$ ).
$C_{in1,2}$	Input coupling capacitor that blocks the DC voltage at the amplifier's input terminal.
$R_{feed1,2}$	Feedback resistor that sets the closed loop gain in conjunction with $R_{in}$ . $A_v = \text{closed loop gain} = -R_{feed}/R_{in}$ .
$C_b$	Half supply bypass capacitor
$C_s$	Supply bypass capacitor that provides power supply filtering.

## 2 Absolute maximum ratings and operating conditions

**Table 2. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6	V
$V_i$	Input voltage	-0.3V to $V_{CC} + 0.3V$	V
$T_{stg}$	Storage temperature	-65 to +150	°C
$T_j$	Maximum junction temperature	150	°C
$R_{thja}$	Thermal resistance junction to ambient DFN10	120	°C/W
$P_{diss}$	Power dissipation <sup>(2)</sup> DFN10	1.79	W
ESD	Human body model (pin to pin)	2	kV
ESD	Machine model 220pF - 240pF (pin to pin)	200	V
Latch-up	Latch-up immunity (all pins)	200	mA
	Lead temperature (soldering, 10 sec)	260	°C
	Output current	170 <sup>(3)</sup>	mA

1. All voltage values are measured with respect to the ground pin.
2.  $P_d$  is calculated with  $T_{amb} = 25^\circ\text{C}$ ,  $T_{junction} = 150^\circ\text{C}$ .
3. Caution: this device is not protected in the event of abnormal operating conditions, such as for example, short-circuiting between any one output pin and ground, between any one output pin and  $V_{CC}$ , and between individual output pins.

**Table 3. Operating conditions**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	2.2 to 5.5	V
$R_L$	Load resistor	$\geq 16$	Ω
$T_{oper}$	Operating free air temperature range	-40 to + 85	°C
$C_L$	Load capacitor $R_L = 16$ to $100\Omega$ $R_L > 100\Omega$	400 100	pF
$V_{STBY}$	Standby voltage input TS4909 in STANDBY TS4909 in active state	$GND \leq V_{STBY} \leq 0.4$ <sup>(1)</sup> $1.35V \leq V_{STBY} \leq V_{CC}$	V
$V_{SE/PHG}$	Single-ended or phantom ground configuration voltage input TS4909 outputs in single-ended configuration TS4909 outputs in phantom ground configuration	$V_{SE/PHG}=V_{CC}$ $V_{SE/PHG}=0$	V
$R_{thja}$	Thermal resistance junction-to-ambient DFN10 <sup>(2)</sup>	41	°C/W

1. The minimum current consumption ( $I_{STBY}$ ) is guaranteed at ground for the whole temperature range.
2. When mounted on a 4-layer PCB.

### 3 Electrical characteristics

## 4 Application information

### 4.1 General description

The TS4909 integrates two monolithic power amplifiers. The amplifier output can be configured to provide either single-ended (SE) capacitively-coupled output or phantom ground (PHG) capacitor-less output. [Figure 1: Typical applications for the TS4909 on page 5](#) shows schematics for each of these configurations.

#### Single-ended configuration

In the single-ended configuration, an output coupling capacitor,  $C_{out}$ , on the output of the power amplifier ( $V_{out1}$  and  $V_{out2}$ ) is mandatory. The output of the power amplifier is biased to a DC voltage equal to  $V_{CC}/2$  and the output coupling capacitor blocks this reference voltage.

#### Phantom ground configuration

In the phantom ground configuration, an internal buffer ( $V_{out3}$ ) maintains the  $V_{CC}/2$  voltage and the output of the power amplifiers are also biased to the  $V_{CC}/2$  voltage. Therefore, no output coupling capacitors are needed. This is of primary importance in portable applications where space constraints are continually present.

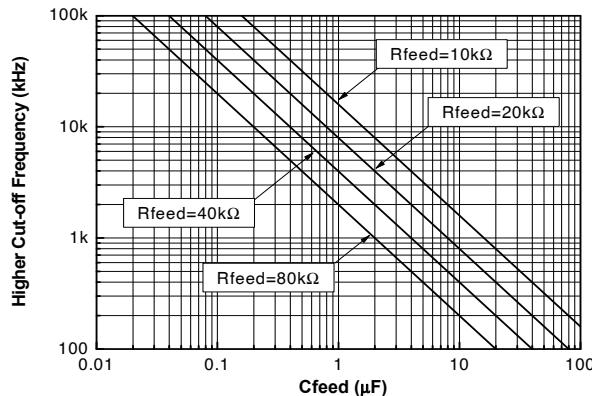

### 4.2 Frequency response

#### Higher cut-off frequency

In the high frequency region, you can limit the bandwidth by adding a capacitor  $C_{feed}$  in parallel with  $R_{feed}$ . It forms a low-pass filter with a -3 dB cut-off frequency  $F_{CH}$ . Assuming that  $F_{CH}$  is the highest frequency to be amplified (with a 3 dB attenuation), the maximum value of  $C_{feed}$  is:

$$F_{CH} = \frac{1}{2\pi \cdot R_{feed} \cdot C_{feed}}$$

**Figure 77. Higher cut-off frequency vs. feedback capacitor**

### Lower cut-off frequency

The lower cut-off frequency  $F_{CL}$  of the TS4909 depends on input capacitors  $C_{in1,2}$ . In the single-ended configuration,  $F_{CL}$  depends on output capacitors  $C_{out1,2}$  as well.

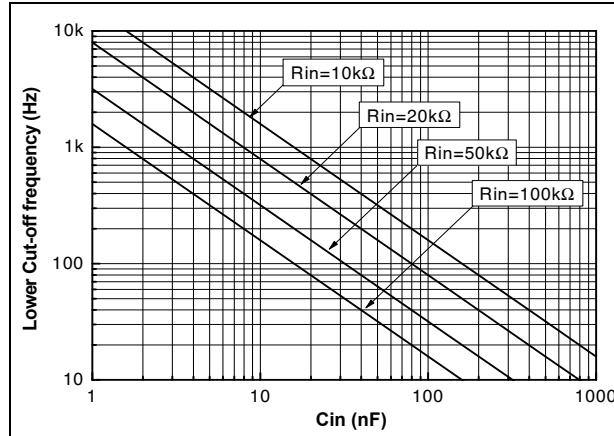

The input capacitor  $C_{in}$  in series with the input resistor  $R_{in}$  of the amplifier is equivalent to a first-order high-pass filter. Assuming that  $F_{CL}$  is the lowest frequency to be amplified (with a 3 dB attenuation), the minimum value of  $C_{in}$  is:

$$C_{in} = \frac{1}{2\pi \cdot F_{CL} \cdot R_{in}}$$

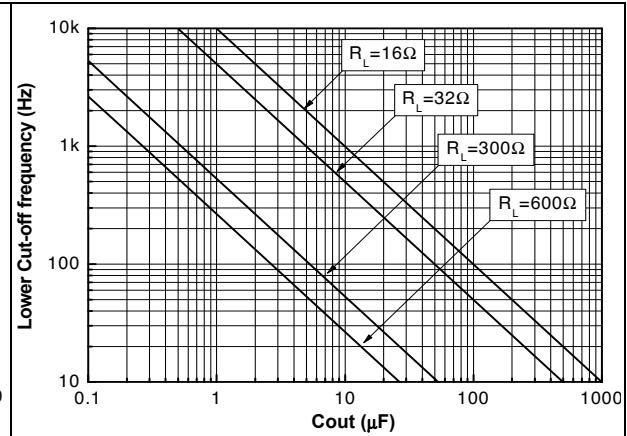

In the single-ended configuration, the capacitor  $C_{out}$  in series with the load resistor  $R_L$  is equivalent to a first-order high-pass filter. Assuming that  $F_{CL}$  is the lowest frequency to be amplified (with a 3 dB attenuation), the minimum value of  $C_{out}$  is:

$$C_{out} = \frac{1}{2\pi \cdot F_{CL} \cdot R_L}$$

**Figure 78. Lower cut-off frequency vs. input capacitor**

**Figure 79. Lower cut-off frequency vs. output capacitor**

**Note:** If  $F_{CL}$  is kept the same for calculation purposes, it must be taken into account that the 1st-order high-pass filter on the input and the 1st-order high-pass filter on the output create a 2nd-order high-pass filter in the audio signal path with an attenuation of 6 dB on  $F_{CL}$  and a roll-off of 40 db/decade.

### 4.3 Gain using the typical application schematics

In the flat region (no  $C_{in}$  effect), the output voltage of a channel is:

$$V_{OUT} = V_{IN} \cdot \left( -\frac{R_{feed}}{R_{in}} \right) = V_{IN} \cdot A_V$$

The gain  $A_V$  is:

$$A_V = -\frac{R_{feed}}{R_{in}}$$

**Note:** The configuration (either single-ended or phantom ground) has no effect on the value of the gain.

## 4.4 Power dissipation and efficiency

### Hypotheses

- Voltage and current ( $V_{out}$  and  $I_{out}$ ) in the load are sinusoidal.
- The supply voltage ( $V_{CC}$ ) is a pure DC source.

Regarding the load we have:

$$V_{OUT} = V_{PEAK} \sin \omega t (V)$$

and

$$I_{OUT} = \frac{V_{OUT}}{R_L} (A)$$

and

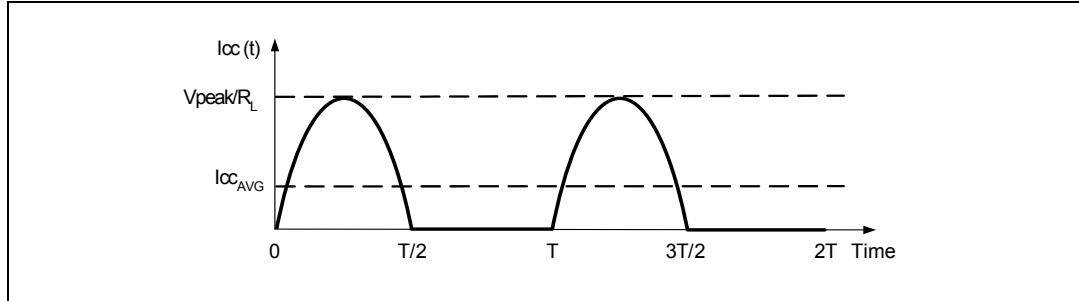

$$P_{OUT} = \frac{V_{PEAK}^2}{2R_L} (W)$$

### 4.4.1 Single-ended configuration

The average current delivered by the power supply voltage is:

$$I_{CC_{AVG}} = \frac{1}{2\pi} \int_0^\pi \frac{V_{PEAK}}{R_L} \sin(t) dt = \frac{V_{PEAK}}{\pi R_L} (A)$$

**Figure 80. Current delivered by power supply voltage in single-ended configuration**

The power delivered by the power supply voltage is:

$$P_{supply} = V_{CC} I_{CC_{AVG}} (W)$$

Therefore, the power dissipation by each power amplifier is:

$$P_{diss} = P_{supply} - P_{OUT} (W)$$

$$P_{diss} = \frac{\sqrt{2}V_{CC}}{\pi\sqrt{R_L}} \sqrt{P_{OUT}} - P_{OUT} (W)$$

and the maximum value is obtained when:

$$\frac{\partial P_{diss}}{\partial P_{OUT}} = 0$$
