

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## 300MHz Single Supply Video Amplifier with Low In/Out Rail

- **Bandwidth: 300MHz**
- **Single supply operation down to 3V**
- **Low input & output rail**
- **Very low harmonic distortion**
- **Slew rate: 400V/μs**
- **Voltage Input noise: 7nV/√Hz**
- **Specified for 150Ω load and 100Ω load**
- **Tested on 5V power supply**
- **Data min. and max. are tested during production (Table 3)**

### Description

The TSH341 is a single supply operational amplifier featuring a large bandwidth of 300MHz at unity gain for only 9.8mA of quiescent current.

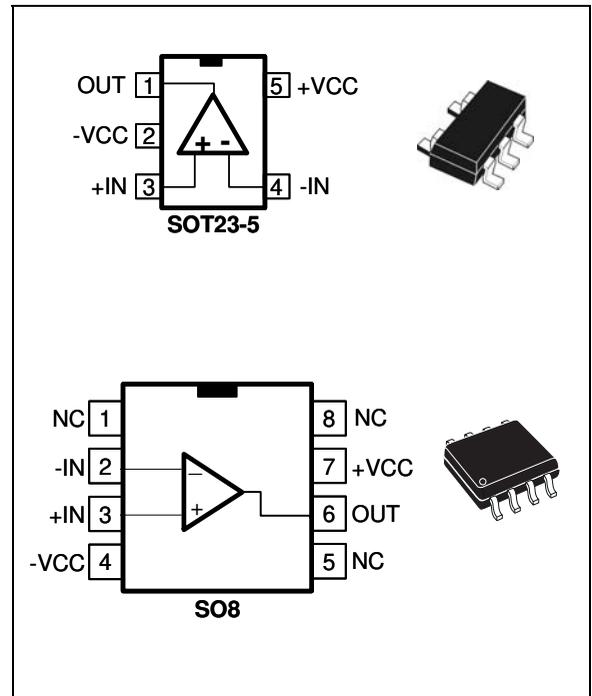

An **advantage** of this circuit is its low input and output rail feature which is very close to GND in single supply. This rail is tested and guaranteed during production at 60mV (max.) from GND on a 150Ω load. This allows a good output swing which fits perfectly when driving a video signal on a 75Ω video line. *Chapter 5* gives technical support when using the TSH341 as a driver for video DAC output on a video line. In particular, this chapter focuses on applying a video signal DC shift to avoid any clamping of the synchronization tip.

The TSH341 is available in the tiny SOT23-5 and SO8 plastic packages.

- 1) All voltage values, except differential voltage are with respect to network terminal.
- 2) Differential voltage are non-inverting input terminal with respect to the inverting input terminal.
- 3) The magnitude of input and output voltage must never exceed  $V_{CC} + 0.3V$ .
- 4) An output current limitation protects the circuit from transient currents. Short-circuits can cause excessive heating. Destructive dissipation can result from short circuit on amplifiers.

### 3 Evaluation Boards

An evaluation board kit optimized for high speed operational amplifiers is available (order code: KITHSEVAL/STDL). The kit includes the following evaluation boards, as well as a CD-ROM containing datasheets, articles, application notes and a user manual:

- SOT23\_SINGLE\_HF BOARD: Board for the evaluation of a single high-speed op-amp in SOT23-5 package.
- SO8\_SINGLE\_HF: Board for the evaluation of a single high-speed op-amp in SO8 package.
- SO8\_DUAL\_HF: Board for the evaluation of a dual high-speed op-amp in SO8 package.
- SO8\_S\_MULTI: Board for the evaluation of a single high-speed op-amp in SO8 package in inverting and non-inverting configuration, dual and single supply.
- SO14\_TRIPLE: Board for the evaluation of a triple high-speed op-amp in SO14 package with video application considerations.

#### Board material:

- 2 layers
- FR4 ( $\epsilon_r=4.6$ )
- epoxy 1.6mm
- copper thickness: 35 $\mu$ m

## 4 Power Supply Considerations

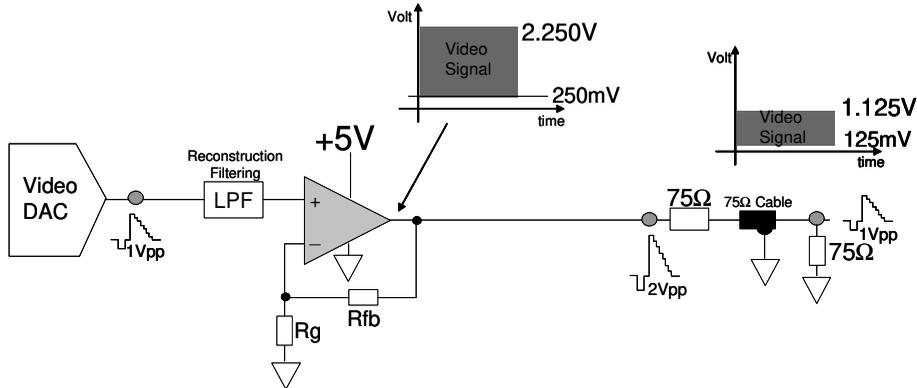

Correct power supply bypassing is very important for optimizing performance in high-frequency ranges. Bypass capacitors should be placed as close as possible to the IC pins to improve high-frequency bypassing. A capacitor greater than  $10\mu\text{F}$  is necessary to minimize the distortion. For better quality bypassing, a capacitor of  $10\text{nF}$  is added using the same implementation conditions. Bypass capacitors must be incorporated for both the negative and the positive supply. On the SO8\_SINGLE\_HF board, these capacitors are C8 and C6.

**Figure 24: Circuit for power supply bypassing**

## 5 Using the TSH341 to Drive Video Signals

Figure 25. Implementation of the video driver on output video DACs

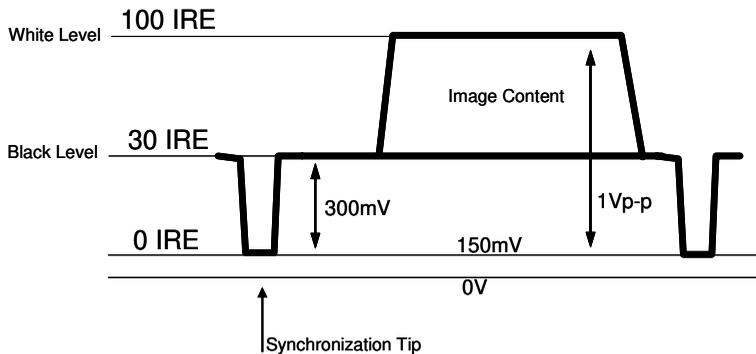

$$V_{OL}(50\text{MHz}) = 150\text{mV} \text{ (Figure 8)}$$

To drive the video signal properly, the output of the driver must be at least equal to 250mV (assuming  $V_{iO}$  and  $V_{OL}$  variations).

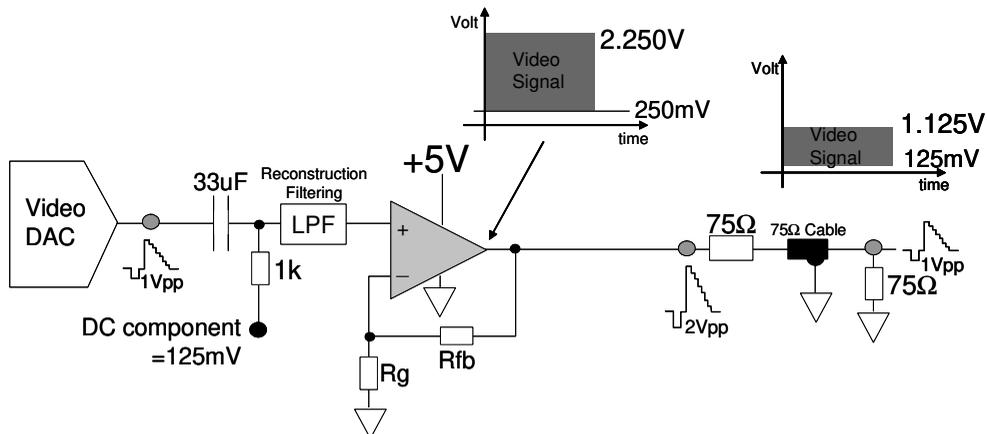

- **1st solution:**

Set the video DAC 0-IRE output level to 125mV.

- **2nd solution:**

Implementation of a DC component in the input of the driver.
