# imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# TSH511

### Hi-fi stereo/mono infrared receiver and stereo sub-carrier demodulator

### Features

- Supply voltage: 2.3V to 5.5V
- Carriers frequency range: 0.4MHz to 11MHz
- Two FM receivers for stereo
- Integrated audio buffers
- Audio outputs: 20mW into 16 ohms
- High sensitivity: 4µV @12dB SINAD
- Flexibility: access pins for each section
- Receiver 2 Standby for mono operation

### **Applications**

- Infrared hi-fi stereo receiver
- Infrared multimedia headsets
- Stereo sub-carrier demodulator
- FM IF receiver systems
- Power line carrier intercoms

### Description

The TSH511 is a 0.4 to 11MHz dual FM receiver. This circuit offers the functions needed for a highly sensitive infrared hi-fi stereo receiver.

Featuring high input sensitivity and high input dynamic range, each receiver integrates an RF front-end LNA, an intermediate amplifier with 2 external filters, a voltage limiter, a quadrature FM demodulator, and finally an audio buffer.

The integrated audio buffers are able to directly drive a 16-ohm headphone with 20mW. A squelch circuit mutes both audio amplifiers.

Access pins to each section makes the TSH511 suited for a wide field of applications.

For mono applications, the standby pin enables one receiver only, reducing the supply current.

The TSH511 forms a chipset with the dual transmitter TSH512.

## 6 Typical application schematics

Figure 20 shows a typical layout for the stereo infrared receiver.

Figure 20. Stereo infrared receiver

### 7 Application information

This section provides application information for some typical applications.

### 7.1 Infrared stereo headphone application

The right side of *Figure 21* shows the block diagram of an infrared stereo receiver using the TSH511. The sensitive LNA, directly connected to the photo diode, does not require an external pre-amplifier. After filtering, the amplified signals are limited and demodulated with quadrature demodulators. The two integrated audio buffers directly drive the stereo headphones. The audio power reaches 2x20mW in two 16 $\Omega$  loads. The built-in squelch function fades out the audio when the incoming infrared signal is low. The standby inputs SBY1 and SBY2 enable only one receiver for the mono applications.

The infrared carriers are detected by the photo diode and the signal is directly amplified by the TSH511. Each receiver has a standard bandpass filter (filters F1 & F2) to select the 2.3MHz and 2.8MHz carriers. After the FM demodulators, the potentiometer P1 controls the volume levels. The stereo headphones are directly connected to the integrated audio buffers. The potentiometer P2 allows adjustment of the sensitivity of the Squelch. The Squelch function fades in and fades out the audio signal, depending on the level of the 2.8MHz carrier.

Figure 22. Stereo headphone application diagram

### 7.2 Multimedia application

#### Headset side

As shown in *Figure 23*, the TSH511 receives the hi-fi stereo sound from the computer through 2.3MHz and 2.8MHz stereo infrared carriers. The access pins to the RF amplifiers allow the use of a 1.7MHz reject filter to cancel the transmitted signal of the microphone. The wide supply range (2.3V to 5.5V) allows battery operation.

57

#### **Computer side**

In multimedia applications, the TSH511 receives the voice of the user through the 1.7MHz infrared carrier. The standby pins can disable the unused receiver and audio amplifier to reduce the supply current (see *Figure 24*).

Figure 24. Computer side block diagram

### 8 General description

The TSH511 is a 0.4MHz to 11MHz dual FM analog receiver. The incoming signal is amplified with a 22dB low noise amplifier (LNA) section. The good noise performance of the LNA allows the photo diode for infrared applications to be connected directly to the TSH511 without any external preamplifier. The access pins for each section and the two standby configurations offer high versatility for many applications: hi-fi stereo infrared receiver, mono/stereo subcarrier receiver, power line carrier audio.

Figure 25. TSH511 block diagram

The LNA is common to both receivers but the output is split in two: one for each receiver. Each LNA output can be connected to a first optional filter for bandpass or reject filtering.

The filtered signal is amplified with an intermediate amplifier (AMP) section followed by a second filter. The AMP sections have 20dB typical gain.

Finally, the signal is amplified and limited in the limiter (LIM) section. The 60dB amplifierlimiter LIM provides a constant amplitude signal to the demodulator. It reduces AM parasitic demodulation in the FM demodulator.

The FM demodulator is a classic quadrature detector that uses an external tank.

The demodulated signal can be amplified by the audio buffer section after de-emphasis. Each audio buffer can drive a  $16\Omega$  headphone with 20mW power.

The two standby pins SBY1 & SBY2 allow the second receiver RX2 to be put into standby for mono operation. In mono mode, it is possible to use both audio buffers or only one depending on the combination on SBY1 & SBY2.

To avoid noise at the audio output, a squelch section mutes the audio buffers when no carrier is received. The squelch section uses the demodulated signal of the first receiver (RX1). This signal is high-pass filtered, rectified and compared to a threshold to produce the Mute signal (pin 25). When no carrier is received on RX1, the wideband 'FM noise' on the demodulator increases and the Mute signal mutes both audio buffers. When the carrier is present, the wideband noise on the demodulator output decreases, enabling the audio buffer.

| Table 5. | Infrared | audio | freq | uencies |
|----------|----------|-------|------|---------|
|----------|----------|-------|------|---------|

| IR frequency in MHz | Applications            |
|---------------------|-------------------------|
| 1.6                 | AM mono                 |
| 1.7                 | FM mono                 |
| 2.3                 | FM right channel        |
| 2.8                 | FM left channel or mono |

### 8.1 LNA section: low noise amplifier

The low noise amplifier (LNA) has a typical gain of 22dB to amplify the incoming RF signal from the photo diode. The LNA is common to both receiver sections RX1 and RX2.

Figure 26. LNA schematics

The LNA output is directly connected to LNA-OUT1 and LNA-OUT2 pins in parallel (pin 8 and 4 respectively). Because the LNA minimum impedance load is  $1k_{\Omega}$  the load impedance on each pin LNA-OUT1 or LNA-OUT2 must be  $2k_{\Omega}$  minimum.

The series  $50_{\Omega}$  resistor and the 100nF capacitor decouple the LNA supply voltage (pin 5), thus improving noise performance.

### 8.2 AMP and LIM sections: amplifier and limiter

The first filter output is connected to the intermediate amplifier AMP. The gain of AMP is typically 20dB. The second filter is connected between the output of AMP and the input of the limiter LIM. The 60dB limiter LIM provides a constant amplitude signal to the FM demodulator. It reduces the AM parasitic effects into the FM demodulator.

Figure 27. AMP and LIM schematics

#### 8.3 FM demodulator section

The FM demodulator is a classic quadrature demodulator based on a multiplier. The quadrature is performed with the tank circuit  $L_{lo}$  inductor and  $C_{lo}$  capacitor. The tank circuit is tuned on the receiving frequency.

The R<sub>lo</sub> resistor is connected in parallel with L<sub>lo</sub> and C<sub>lo</sub> to reduce the Q factor of the tank circuit. It allows to adjust the demodulation characteristics. For a given transmitting deviation, a lower value of R<sub>lo</sub> gives a lower demodulated amplitude and reduces the distortion.

The AC amplitude on pin 18 must not exceed  $300mV_{RMS}$  to prevent clipping by the internal ESD diodes of the circuit.

#### 8.4 Squelch section

To avoid audio FM noise at the speakers when no carrier is received, the TSH511 has a built-in squelch circuit. The squelch detects the wideband FM noise on the demodulated output and fades out the audio of both audio buffers.

The audio is filtered from the FM noise using the high-pass RC filter. The cut-off frequency is typically 100kHz. The squelch level depends on the value of the  $R_{MUTE}$  resistor in series with the input pin of the noise amplifier MUTE-IN (pin 23). The detected noise is integrated with the  $C_{peak}$  capacitor connected to MUTE-INT pin. The DC voltage on this pin follows the amplitude of the noise.

The comparator and the  $C_{MUTE}$  capacitor generate the fade-in and fade-out control ramps for the audio buffers. The squelch was designed with particular attention to avoid audio popnoise.

The squelch section is driven by the receiver RX1 but controls both audio buffers.

### 8.5 Audio buffer sections

The audio signal from an FM demodulator enters into the 6dB/octave low-pass filter for deemphasis. 50µs and 75µs are standard de-emphasis values.

After the de-emphasis network, the potentiometer controls the volume.

The rail-to-rail output stage of each audio buffer is able to drive 20mW into  $16\Omega$  at 2.3V supply voltage. Under these conditions, the distortion is typically 0.3% before saturation.

The audio buffers can also drive the other usual impedances used in audio:  $32\alpha$ ,  $600\alpha$  and  $10k\alpha$  (see the corresponding distortion curves).

The high input impedances of the audio buffers reduce the coupling capacitors to less than  $0.1\mu F$  allowing space and cost saving.

the

one

#### Standby section 8.6

Depending on the state of the logic inputs SBY1 and SBY2, RX2 and the Audio Buffer 2 can be disabled separately. The TSH511 receiver can adapt to different applications by using the SBY1 & SBY2 standby pins.

| Table 6. St    | andby pin des  | cription            |     |                |                            |
|----------------|----------------|---------------------|-----|----------------|----------------------------|
| SBY1<br>pin 32 | SBY2<br>pin 31 | RX1 & audio buffer1 | RX2 | Audio buffer 2 | Typical use                |
| Low            | Low            | ON                  | ON  | ON             | stereo                     |
| Low            | High           |                     | ÖN  | ÖN             | 316160                     |
| High           | Low            | ON                  | OFF | ON             | mono on the<br>two outputs |
| High           | High           | ON                  | OFF | OFF            | mono on one<br>output      |

In the standard stereo mode, the configuration is: SBY1 = SBY2 = Low.

In mono mode with one load (example: a single load speaker), RX2 and Audio Buffer 2 are disabled, the configuration is SBY1 = SBY2 = High.

In mono mode with a stereo load (for example: a stereo headphone), the configuration is SBY1 = High, SBY2 = Low.

A pin is in High state if connected to V<sub>CC</sub>, and is in Low state if connected to GND.

#### **Package information** 9

In order to meet environmental requirements, STMicroelectronics offers these devices in ECOPACK<sup>®</sup> packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an STMicroelectronics trademark. ECOPACK specifications are available at: www.st.com.

| 01-Dec-2003   | 2        | Datasheet updated for Maturity 30:<br>– Electrical parameters updated<br>– Application diagrams updated<br>– Releases on curves |
| 01-April-2005 | 3        | R <sub>thja</sub> value added on <i>Table 2</i> on page 5   |
| 5-Jul-2007    | 4        | Value of F <sub>carrier</sub> reduced to 2.8MHz in LNA section in <i>Table 4</i> .<br>Format update.                            |
| 12-Nov-2007   | 5        | Added PPAP reference in Table 7: Order codes.   |

#### Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED ST REPRESENTATIVE, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.

ST and the ST logo are trademarks or registered trademarks of ST in various countries.

Information in this document supersedes and replaces all information previously supplied.

The ST logo is a registered trademark of STMicroelectronics. All other names are the property of their respective owners.
