

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

### Related products

- See TSV631, TSV632, TSV634 series for lower minimum supply voltage (1.5 V)
- See LMV821, LMV822, LMV824 series for higher gain bandwidth products (5.5 MHz)

### Applications

- Battery powered applications
- Portable devices
- Automotive signal conditioning
- Active filtering
- Medical instrumentation

### Description

The TSV52x and TSV52xA series of operational amplifiers offer low voltage operation and rail-to-rail input and output. The TSV521 device is the single version, the TSV522 device the dual version, and the TSV524 device the quad version, with pinouts compatible with industry standards.

The TSV52x and TSV52xA series offer an outstanding speed/power consumption ratio, 1.15 MHz gain bandwidth product while consuming only 45  $\mu$ A at 5 V. The devices are housed in the smallest industrial packages.

These features make the TSV52x, TSV52xA family ideal for sensor interfaces, battery supplied and portable applications. The wide temperature range and high ESD tolerance facilitate their use in harsh automotive applications.

### Features

- Gain bandwidth product: 1.15 MHz typ. at 5 V
- Low power consumption: 45  $\mu$ A typ. at 5 V
- Rail-to-rail input and output
- Low input bias current: 1 pA typ.
- Supply voltage: 2.7 to 5.5 V
- Low offset voltage: 800  $\mu$ V max.
- Unity gain stable on 100 pF capacitor
- Automotive grade

### Benefits

- Increased lifetime in battery powered applications
- Easy interfacing with high impedance sensors

# 1 Package pin connections

Figure 1. Pin connections for each package (top view)

1. The exposed pads of the DFN8 (2x2) and QFN16 (3x3) can be connected to VCC- or left floating.

## 2 Absolute maximum ratings and operating conditions

**Table 2. Absolute maximum ratings (AMR)**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6	V
$V_{id}$	Differential input voltage <sup>(2)</sup>	$\pm V_{CC}$	
$V_{in}$	Input voltage <sup>(3)</sup>	$V_{CC-} - 0.2$ to $V_{CC+} + 0.2$	
$I_{in}$	Input current <sup>(4)</sup>	10	mA
$T_{stg}$	Storage temperature	-65 to +150	°C
$R_{thja}$	Thermal resistance junction-to-ambient <sup>(5)(6)</sup>		°C/W
	SC70-5	205	
	DFN8 2x2	57	
	QFN16 3x3	45	
	MiniSO8	190	
	TSSOP14	100	
$T_j$	Maximum junction temperature	150	°C
ESD	HBM: human body model <sup>(7)</sup>	4	kV
	MM: machine model <sup>(8)</sup>	300	V
	CDM: charged device model <sup>(9)</sup> (all packages except SC70-5 and DFN8)	1.5	kV
	CDM: charged device model (SC70-5 and DFN8) <sup>(9)</sup>	1.3	
	Latch-up immunity	200	mA

1. All voltage values, except differential voltages are with respect to network ground terminal.
2. Differential voltages are the non inverting input terminal with respect to the inverting input terminal.
3.  $V_{CC-} - V_{in}$  must not exceed 6 V,  $V_{in}$  must not exceed 6 V.
4. Input current must be limited by a resistor in series with the inputs.
5. Short-circuits can cause excessive heating and destructive dissipation.
6.  $R_{th}$  are typical values.
7. Human body model: 100 pF discharged through a 1.5 kΩ resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
8. Machine model: a 200 pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
9. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to ground.

**Table 3. Operating conditions**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	2.7 to 5.5	V
$V_{icm}$	Common-mode input voltage range	$V_{CC-} - 0.1$ to $V_{CC+} + 0.1$	
$T_{oper}$	Operating free air temperature range	-40 to +125	°C

### 3 Electrical characteristics

1. See [Section 4.6: Input offset voltage drift over temperature](#).
2. Typical value is based on the  $V_{io}$  drift observed after 1000 h at 125 °C extrapolated to 25 °C using the Arrhenius law and assuming an activation energy of 0.7 eV. The operational amplifier is aged in follower mode configuration.
3. Guaranteed by design.

## 4 Application information

### 4.1 Operating voltages

The amplifiers of the TSV52x, TSV52xA series can operate from 2.7 V to 5.5 V. Their parameters are fully specified for 2.7 V, 3.3 V and 5 V power supplies. However, the parameters are very stable in the full  $V_{CC}$  range and several characterization curves show the TSV52x, TSV52xA device characteristics at 2.7 V. Additionally, the main specifications are guaranteed in extended temperature ranges from -40 to +125 °C.

### 4.2 Common-mode voltage range

The TSV52x, TSV52xA devices are built with two complementary PMOS and NMOS input differential pairs. The devices have a rail-to-rail input and the input Common-mode range is extended from  $V_{CC-} - 0.1$  V to  $V_{CC+} + 0.1$  V.

The N channel pair is active for input voltage close to the positive rail typically ( $V_{CC+} - 0.7$  V) to 100 mv above the positive rail.

The P channel pair is active for input voltage close to the negative rail typically 100 mV below the negative rail to  $V_{CC-} + 0.7$  V.

And between  $V_{CC-} + 0.7$  V and  $V_{CC+} - 0.7$  V the both N and P pairs are active.

When the both pairs work together it allows to increase the speed of the TSV52x, TSV52xA devices. This architecture improves the merit factor of the whole device. In the transition region, the performance of CMR, SVR,  $V_{io}$  (Figure 25 and Figure 26) and THD is slightly degraded.

Figure 25. Input offset voltage vs. input common-mode at  $V_{CC} = 2.7$  V

Figure 26. Input offset voltage vs. input common-mode at  $V_{CC} = 5.5$  V

### 4.3 Rail-to-rail input

The TSV52x, TSV52xA series are guaranteed without phase reversal as shown in [Figure 28](#).

It is extremely important that the current flowing in the input pin does not exceed 10 mA. In order to limit this current, a serial resistor can be added on the  $V_{in}$  path.

**Figure 27. Phase reversal test schematic**

**Figure 28. No phase reversal**

### 4.4 Rail-to-rail output

The operational amplifier output levels can go close to the rails: 35 mV maximum above and below the rail when connected to a 10 kΩ resistive load to  $V_{CC}/2$ .

### 4.5 Driving resistive and capacitive loads

To drive high capacitive loads, adding an in series resistor at the output can improve the stability of the device (see [Figure 29](#) for the recommended in series value). Once the in series resistor has been selected, the stability of the circuit should be tested on the bench and simulated with simulation models. The  $R_{load}$  is placed in parallel with the capacitive load. The  $R_{load}$  and the in series resistor create a voltage divider which introduces an error proportional to the ratio  $R_s/R_{load}$ . By keeping  $R_s$  as low as possible, this error is generally negligible.

Figure 29. In series resistor versus capacitive load

### 4.6 Input offset voltage drift over temperature

The maximum input voltage drift over the temperature variation is defined as the offset variation related to offset value measured at 25 °C. The operational amplifier is one of the main circuits of the signal conditioning chain, and the amplifier input offset is a major contributor to the chain accuracy. The signal chain accuracy at 25 °C can be compensated during production at application level. The maximum input voltage drift over temperature enables the system designer to anticipate the effect of temperature variations.

The maximum input voltage drift over temperature is computed using [Equation 1](#).

**Equation 1**

$$\frac{\Delta V_{io}}{\Delta T} = \max \left| \frac{V_{io}(T) - V_{io}(25^{\circ}\text{C})}{T - 25^{\circ}\text{C}} \right|$$

with T = -40 °C and 125 °C.

The datasheet maximum value is guaranteed by a measurement on a representative sample size ensuring a C<sub>pk</sub> (process capability index) greater than 1.33.

## 4.7 Long term input offset voltage drift

To evaluate product reliability, two types of stress acceleration are used:

- Voltage acceleration, by changing the applied voltage
- Temperature acceleration, by changing the die temperature (below the maximum junction temperature allowed by the technology) with the ambient temperature.

The voltage acceleration has been defined based on JEDEC results, and is defined using [Equation 2](#).

### Equation 2

$$A_{FV} = e^{\beta \cdot (V_S - V_U)}$$

Where:

$A_{FV}$  is the voltage acceleration factor

$\beta$  is the voltage acceleration constant in 1/V, constant technology parameter ( $\beta = 1$ )

$V_S$  is the stress voltage used for the accelerated test

$V_U$  is the voltage used for the application

The temperature acceleration is driven by the Arrhenius model, and is defined in [Equation 3](#).

### Equation 3

$$A_{FT} = e^{\frac{E_a}{k} \cdot \left( \frac{1}{T_U} - \frac{1}{T_S} \right)}$$

Where:

$A_{FT}$  is the temperature acceleration factor

$E_a$  is the activation energy of the technology based on the failure rate

$k$  is the Boltzmann constant ( $8.6173 \times 10^{-5} \text{ eV.K}^{-1}$ )

$T_U$  is the temperature of the die when  $V_U$  is used (K)

$T_S$  is the temperature of the die under temperature stress (K)

The final acceleration factor,  $A_F$ , is the multiplication of the voltage acceleration factor and the temperature acceleration factor ([Equation 4](#)).

### Equation 4

$$A_F = A_{FT} \times A_{FV}$$

$A_F$  is calculated using the temperature and voltage defined in the mission profile of the product. The  $A_F$  value can then be used in [Equation 5](#) to calculate the number of months of use equivalent to 1000 hours of reliable stress duration.

**Equation 5**

$$\text{Months} = A_F \times 1000 \text{ h} \times 12 \text{ months} / (24 \text{ h} \times 365.25 \text{ days})$$

To evaluate the op-amp reliability, a follower stress condition is used where  $V_{CC}$  is defined as a function of the maximum operating voltage and the absolute maximum rating (as recommended by JEDEC rules).

The  $V_{io}$  drift (in  $\mu\text{V}$ ) of the product after 1000 h of stress is tracked with parameters at different measurement conditions (see [Equation 6](#)).

**Equation 6**

$$V_{CC} = \max V_{op} \text{ with } V_{icm} = V_{CC} / 2$$

The long term drift parameter ( $\Delta V_{io}$ ), estimating the reliability performance of the product, is obtained using the ratio of the  $V_{io}$  (input offset voltage value) drift over the square root of the calculated number of months ([Equation 7](#)).

**Equation 7**

$$\Delta V_{io} = \frac{V_{io} \text{ drift}}{\sqrt{(\text{months})}}$$

where  $V_{io}$  drift is the measured drift value in the specified test conditions after 1000 h stress duration.

**4.8 PCB layouts**

For correct operation, it is advised to add 10 nF decoupling capacitors as close as possible to the power supply pins.

**4.9 Macromodel**

Accurate macromodels of the TSV52x, TSV52xA devices are available on STMicroelectronics™ website at [www.st.com](http://www.st.com). These models are a trade-off between accuracy and complexity (that is, time simulation) of the TSV52x, TSV52xA operational amplifiers. They emulate the nominal performance of a typical device within the specified operating conditions mentioned in the datasheet. They also help to validate a design approach and to select the appropriate operational amplifier, *but they do not replace on-board measurements*.

## 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.
