

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Micropower, wide bandwidth CMOS operational amplifiers

### Features

- Rail-to-rail input and output
- Low power consumption: 29  $\mu\text{A}$  typ, 36  $\mu\text{A}$  max
- Low supply voltage: 1.5 – 5.5 V
- High gain bandwidth product: 1.3 MHz typ
- Stable when used in gain configuration
- Low power shutdown mode: 5 nA typ
- Good accuracy: 800  $\mu\text{V}$  max (A version)
- Low input bias current: 1 pA typ
- Micropackages: MiniSO-8, SOT23-8, MiniSO-10, TSSOP14, TSSOP16
- EMI hardened operational amplifiers
- High tolerance to ESD: 4 kV HBM
- Extended temperature range: -40 to +125° C

### Applications

- Battery-powered applications
- Portable devices
- Signal conditioning
- Active filtering
- Medical instrumentation

### Description

The TSV6292, TSV6293, TSV6294 and TSV6295 dual and quad operational amplifiers offer a high bandwidth of 1.3 MHz while consuming only 29  $\mu\text{A}$ . They must be used in a gain configuration (equal or above +4 or -3).

The TSV629x series features low voltage, low power operation and rail-to-rail input and output. The devices also offer an ultra-low input bias current and low input offset voltage.

The TSV6293 (dual) and TSV6295 (quad) have two shutdown pins for reduced power consumption.

These features make the TSV629x family ideal for sensor interfaces, battery supplied and portable applications, as well as active filtering.

**Table 1. Device summary**

Reference	Dual version		Quad version	
	Without standby	With standby	Without standby	With standby

## 2 Absolute maximum ratings and operating conditions

**Table 2. Absolute maximum ratings (AMR)**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6	V
$V_{id}$	Differential input voltage <sup>(2)</sup>	$\pm V_{CC}$	V
$V_{in}$	Input voltage <sup>(3)</sup>	$V_{CC-} - 0.2$ to $V_{CC+} + 0.2$	V
$I_{in}$	Input current <sup>(4)</sup>	10	mA
$\overline{SHDN}$	Shutdown voltage <sup>(3)</sup>	$V_{CC-} - 0.2$ to $V_{CC+} + 0.2$	V
$T_{stg}$	Storage temperature	-65 to +150	°C
$R_{thja}$	Thermal resistance junction to ambient <sup>(5)(6)</sup>		°C/W
	SOT23-8	105	
	MiniSO-8	190	
	SO-8	125	
	Mini-SO10	113	
	TSSOP14	100	
	TSSOP16	95	
$T_j$	Maximum junction temperature	150	°C
ESD	HBM: human body model <sup>(7)</sup>	4	kV
	MM: machine model <sup>(8)</sup>	200	V
	CDM: charged device model <sup>(9)</sup>	1.5	kV
	Latch-up immunity	200	mA

1. All voltage values, except differential voltages are with respect to network ground terminal.
2. Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
3.  $V_{CC-} - V_{in}$  must not exceed 6 V,  $V_{in}$  must not exceed 6V.
4. Input current must be limited by a resistor in series with the inputs.
5. Short-circuits can cause excessive heating and destructive dissipation.
6.  $R_{th}$  are typical values.
7. Human body model: 100 pF discharged through a 1.5 kΩ resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
8. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
9. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to ground.

**Table 3. Operating conditions**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	1.5 to 5.5	V
$V_{icm}$	Common mode input voltage range	$V_{CC-} - 0.1$ to $V_{CC+} + 0.1$	V
$T_{oper}$	Operating free air temperature range	-40 to +125	°C

## 4 Application information

### 4.1 Operating voltages

The TSV629x can operate from 1.5 to 5.5 V. The devices' parameters are fully specified for 1.8, 3.3 and 5 V power supplies. However, the parameters are very stable in the full  $V_{CC}$  range and several characterization curves show the TSV629x characteristics at 1.5 V. Additionally, the main specifications are guaranteed in extended temperature ranges from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

### 4.2 Rail-to-rail input

The TSV629x are built with two complementary PMOS and NMOS input differential pairs. The devices have a rail-to-rail input, and the input common mode range is extended from  $V_{CC-} - 0.1\text{ V}$  to  $V_{CC+} + 0.1\text{ V}$ . The transition between the two pairs appears at  $V_{CC+} - 0.7\text{ V}$ . In the transition region, the performance of CMR, SVR,  $V_{io}$  (Figure 19 and Figure 20) and THD is slightly degraded.

Figure 19. Input offset voltage vs input common mode at  $V_{CC} = 1.5\text{ V}$

Figure 20. Input offset voltage vs input common mode at  $V_{CC} = 5\text{ V}$

The devices are guaranteed without phase reversal.

### 4.3 Rail-to-rail output

The operational amplifiers' output level can go close to the rails: 35 mV maximum above and below the rail when connected to a  $10\text{ k}\Omega$  resistive load to  $V_{CC}/2$ .

### 4.4 Optimization of DC and AC parameters

These devices use an innovative approach to reduce the spread of the main DC and AC parameters. An internal adjustment achieves a very narrow spread of current consumption (29  $\mu\text{A}$  typical, min/max at  $\pm 17\%$ ). Parameters linked to the current consumption value, such as GBP, SR and  $A_{vd}$  benefit from this narrow dispersion.

### 4.5 Shutdown function (TSV6293, TSV6295)

The operational amplifier is enabled when the  $\overline{\text{SHDN}}$  pin is pulled high. To disable the amplifier, the  $\overline{\text{SHDN}}$  must be pulled down to  $V_{CC-}$ . When in shutdown mode, the amplifier output is in a high impedance state. The  $\overline{\text{SHDN}}$  pin must never be left floating but tied to  $V_{CC+}$  or  $V_{CC-}$ . The turn-on and turn-off times are calculated for an output variation of  $\pm 200\text{ mV}$  (Figure 21 and Figure 22 show the test configurations).

Figure 21. Test configuration for turn-on time (Vout pulled down)

Figure 22. Test configuration for turn-off time (Vout pulled down)

Figure 23. Turn-on time,  $V_{CC} = 5\text{ V}$ ,  $V_{out}$  pulled down,  $T = 25^\circ\text{ C}$

Figure 24. Turn-off time,  $V_{CC} = 5\text{ V}$ ,  $V_{out}$  pulled down,  $T = 25^\circ\text{ C}$

## 4.6 Driving resistive and capacitive loads

These products are micropower, low-voltage operational amplifiers optimized to drive rather large resistive loads, above 5 k $\Omega$ . For lower resistive loads, the THD level may significantly increase.

The amplifiers have a relatively low internal compensation capacitor, making them very fast while consuming very little. They are ideal when used in a non-inverting configuration or in an inverting configuration in the following conditions:

- $|Gain| \geq 3$  in an inverting configuration ( $C_L = 20$  pF,  $R_L = 100$  k $\Omega$ ) or  $|gain| \geq 10$  ( $C_L = 100$  pF,  $R_L = 100$  k $\Omega$ )
- $Gain \geq +4$  in a non-inverting configuration ( $C_L = 20$  pF,  $R_L = 100$  k $\Omega$ ) or  $gain \geq +11$  ( $C_L = 100$  pF,  $R_L = 100$  k $\Omega$ )

As these operational amplifiers are not unity gain stable, the TSV62x (29  $\mu$ A, 420 kHz) or TSV63x (60  $\mu$ A, 880 kHz) – which are unity gain stable – might be a solution for your application.

**Table 9. Related products**

Part #	I <sub>cc</sub> ( $\mu$ A) at 5V	GBP (MHz)	SR (V/ $\mu$ s)	Minimum gain for stability (C <sub>Load</sub> = 100 pF)
TSV622-3-4-5	29	0.42	0.14	1
TSV6292-3-4-5	29	1.3	0.5	+11
TSV632-3-4-5	60	0.88	0.34	1
TSV6392-3-4-5	60	2.4	1.1	+11

## 4.7 PCB layouts

For correct operation, it is advised to add 10 nF decoupling capacitors as close as possible to the power supply pins.

## 4.8 Macromodel

Two accurate macromodels (with or without shutdown feature) of the TSV629x are available on STMicroelectronics' web site at [www.st.com](http://www.st.com). This model is a trade-off between accuracy and complexity (that is, time simulation) of the TSV629x operational amplifiers. It emulates the nominal performances of a typical device within the specified operating conditions mentioned in the datasheet. It also helps to validate a design approach and to select the right operational amplifier, but it does not replace on-board measurements.

## 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.
