mail

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

Rev. 06 — 20 January 2005

Product data sheet

1. General description

The TZA3011 is a fully integrated laser driver for optical transmission systems with data rates up to 3.2 Gbit/s. The TZA3011 incorporates all the necessary control and protection functions for a laser driver application with very few external components required and low power dissipation. The dual-loop controls the average monitor current in a programmable range from 150 μ A to 1300 μ A and the extinction ratio in a programmable range from 5 to 15 (linear scale).

The design is made in the Philips BiCMOS RF process and is available in a HBCC32 package or as bare die. The TZA3011A is intended for use in an application with an AC-coupled laser diode with a 3.3 V laser supply voltage. The TZA3011B is intended for use in an application with a DC-coupled laser diode for both 3.3 V and 5 V laser supply voltages.

2. Features

2.1 General

- A-rateTM from 30 Mbit/s to 3.2 Gbit/s
- Bias current up to 100 mA
- Modulation current up to 100 mA
- Rise and fall times typical 80 ps
- Jitter below 20 ps (peak-to-peak value)
- Modulation output voltage up to 2 V dynamic range
- 1.2 V minimum voltage on the modulation output pin and 0.4 V minimum voltage on pin BIAS
- Retiming function via external clock with disable option
- Pulse width adjustment function with disable option
- Positive Emitter Coupled Logic (PECL), Low Voltage Positive Emitter Coupled Logic (LVPECL) and Current-Mode Logic (CML) compatible data and clock inputs
- Internal common mode voltage available for AC-coupled data and clock inputs and for single-ended applications
- 3.3 V supply voltage
- TZA3011A: AC-coupled laser for 3.3 V laser supply
- TZA3011B: DC-coupled laser for 3.3 V and 5 V laser supply

PHILIPS

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

2.2 Control features

- Dual-loop control for constant and accurate optical average power level and extinction ratio (up to 2.7 Gbit/s)
- Optional average power loop control (up to 3.2 Gbit/s)
- Optional direct setting of modulation and bias currents

2.3 **Protection features**

- Alarm function on operating current
- Alarm function on monitor current
- Enable function on bias and modulation currents
- Soft start on bias and modulation currents

3. Applications

- SDH/SONET optical transmission systems
- High current drivers for converters
- High current drivers for high frequencies

4. Ordering information

Table 1: Ordering information							
Type number Package							
	Name	Description	Version				
TZA3011AVH	HBCC32	plastic thermal enhanced bottom chip carrier;	SOT560-1				
TZA3011BVH	-	32 terminals; body $5 \times 5 \times 0.65$ mm					
TZA3011UH	-	bare die; $2560\times 2510\times 380~\mu m$	-

[1] All GND connections should be used.

All ground pads must be connected to ground.

Recommended order of bonding: all GND first, then V_{CCA} , V_{CCD} and V_{CCO} supplies and finally the input and output pins.

All coordinates are referenced, in μ m, to the center of the die.

[2] Pad is internally connected, do not use.

[3] ACDC pad must be left unconnected for AC-coupling applications. For DC-coupling applications, connect this pad to ground.

Table 4: Physical characteristics of TZA3011UH

Parameter	Value
Glass passivation	$0.3~\mu m$ PSG (Phospho Silicate Glass) on top of 0.8 μm of silicon nitride
Bonding pad dimension	minimum dimension of exposed metallization is 80 μm \times 80 μm (pad size = 90 μm \times 90 $\mu m)$
Metallization	2.8 μm AlCu
Thickness	380 μm nominal
Size	$2.560 \text{ mm} \times 2.510 \text{ mm}$ (6.43 mm ²)
Backing	silicon; electrically connected to GND potential through substrate contacts
Attach temperature	< 440 °C; recommended die attachment is by gluing
Attach time	< 15 s

7. Functional description

7.1 Data and clock input

The TZA3011 operates with differential Positive Emitter Coupled Logic (PECL), Low Voltage Positive Emitter Coupled Logic (LVPECL) and Current-Mode Logic (CML) data and clock inputs with a voltage swing from 100 mV to 1 V (p-p). It is assumed that both the data and clock inputs carry a complementary signal with the specified peak-to-peak value (true differential excitation).

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

The circuit generates an internal common mode voltage for AC-coupled data and clock inputs and for single-ended applications.

If $V_{DIN} > V_{DINQ}$, the modulation current is sunk by the LA pins and corresponds to an optical 'one' level of the laser.

7.2 Retiming

The retiming function synchronizes the data with the clock to improve the jitter performance. The data latch switches on the rising edge of the clock input. The retiming function is disabled when both clock inputs are below 0.3 V.

At start-up the initial polarity of the laser is unknown before the first rising edge of the clock input.

7.3 Pulse width adjustment

The on-duration of the laser current can be adjusted from -100 ps to +100 ps. The adjustment time is set by resistor R_{PWA}. The maximum allowable capacitive load on pin PWA is 100 pF. Pulse width adjustment is disabled when pin PWA is short-circuited to ground.

7.4 Modulator output stage

The output stage is a high-speed bipolar differential pair with typical rise and fall times of 80 ps and with a modulation current source of up to 100 mA when the LA pins are connected to V_{CCO} .

The modulation current switches between the LA and LAQ outputs. For a good RF performance the inactive branch carries a small amount of the modulation current.

The LA output is optimized for the laser allowing a 2 V dynamic range and a 1.2 V minimum voltage. The LAQ output is optimized for the dummy load.

The output stage of the TZA3011A is optimized for AC-coupled lasers and the output stage of the TZA3011B is optimized for DC-coupled lasers.

The BIAS output is optimized for low voltage requirements (0.4 V minimum for a 3.3 V laser supply; 0.8 V minimum for a 5 V laser supply).

7.5 Dual-loop control

The TZA3011 incorporates a dual-loop control for a constant, accurate and temperature-independent control of the optical average power level and the extinction ratio. The dual-loop guarantees constant optical 'one' and 'zero' levels which are independent of the laser temperature and the laser age.

The dual-loop operates by monitoring the current of the monitor photodiode which is directly proportional to the laser emission. The 'one' and 'zero' current levels of the monitor diode are captured by the detector of the dual-loop control. The pin MON for the monitor photodiode current is an RF input.

The average monitor current is programmable over a wide current range from 150 μA to 1300 μA for both the dual-loop control and the average loop control. The extinction ratio is programmable from 5 to 15.

The maximum allowable capacitive load on pins AVR, ER, BIASOUT and MODOUT is 100 pF.

7.6 Average loop control

The average power control loop maintains a constant average power level of the monitor current over temperature and lifetime of the laser. The average loop control is activated by short-circuiting pin ER to ground.

7.7 Direct current setting

The TZA3011 can also operate in open-loop mode with direct setting of the bias and modulation currents. The bias and modulation current sources are transconductance amplifiers and the output currents are determined by the BIASIN and MODIN voltages respectively. The bias current source has a bipolar output stage with minimum output capacitance for optimum RF performance.

7.8 Soft start

At power-up the bias and modulation current sources are released when $V_{CCA} > 2.7 \text{ V}$ and the reference voltage has reached the correct value of 1.2 V.

The control loop starts with minimum bias and modulation current at power-up and when the device is enabled. The current levels increase until the MON input current matches the programmed average level and, in the case of dual-loop control, the extinction ratio.

7.9 Alarm functions

The TZA3011 features two alarm functions for the detection of excessive laser operating current and monitor diode current due to laser ageing, laser malfunctioning or a too high laser temperature. The alarm threshold levels are programmed by a resistor or a current source. In the TZA3011A, for the AC-coupled application, the operating current is equal to the bias current. In the TZA3011B, for the DC-coupled application, the operating current equals the bias current plus half of the modulation current.

7.10 Enable

A LOW-level on the enable input disables the bias and modulation current sources: the laser is off. A HIGH-level on the enable input or an open enable input switches both current sources on: the laser is operational.

7.11 Reference block

The reference voltage is derived from a band gap circuit and is available at pin RREF. An accurate (1 %) 10 k Ω resistor has to be connected to pin RREF to provide the internal reference current. The maximum capacitive load on pin RREF is 100 pF.

The reference voltage on the setting pins (MAXOP, MAXMON, PWA, ER and AVR) is buffered and derived from the band gap voltage.

The output voltage on pin VTEMP reflects the junction temperature of the TZA3011, the temperature coefficient of V_{VTEMP} equals –2.2 mV/K.

8. Limiting values

Table 5: Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134). All voltages are referenced to ground; positive currents flow into the IC.

Symbol	Parameter	Conditions	Min	Мах	Unit
V _{CCD}	digital supply voltage		-0.5	+3.5	V

[1] The total power dissipation P_{tot} is calculated with $V_{BIAS} = V_{CCO} = 3.3$ V and $I_{BIAS} = 20$ mA. In the application V_{BIAS} will be V_{CCO} minus the laser diode voltage which results in a lower total power dissipation.

[2] The specification of the offset voltage is guaranteed by design.

[3] Any (AVR, ER) settings need to respect I_{MON} > 50 μA and I_{MON} < 2500 μA. Therefore, for large ER settings, minimum/maximum AVR cannot be reached.</p>

[4] The relation between the sink current $I_{o(LA)}$ and the modulation current I_{mod} is: $I_{o(LA)} = I_{mod} \times \frac{100}{100 + Z_{L(LA)}}$ where $Z_{L(LA)}$ is the

external load on pin LA. The voltage on pin MODIN programmes the modulation current I_{mod} . This current is divided between $Z_{L(LA)}$ and the 100 Ω internal resistor connected to pins LA. When the modulation current is programmed to 100 mA, a typical $Z_{L(LA)}$ of 25 Ω will result in an $I_{o(LA)}$ current of 80 mA, while 20 mA flows via the internal resistor. This corresponds to a voltage swing of 2 V on the real application load.

[5] $V_{VTEMP} = 1.31 + TC_{VTEMP} \times T_j$ and $T_j = T_{amb} + P_{tot} \times R_{th(j-a)}$.

[2] With a 25 Ω load on the LA pins: $I_{o(LA)}$ = 14 mA when I_{mod} = 17 mA.

[3] For high modulation current, tr and tf are impacted by total inductance between the LA pins and the laser connection.

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

12. Application information

12.1 Design equations

12.1.1 Bias and modulation currents

The bias and modulation currents are determined by the voltages on pins BIASIN and MODIN. These voltages are applied by pins BIASOUT and MODOUT for dual-loop control. For average loop control the BIASIN voltage is applied by pin BIASOUT and the MODIN voltage is applied by an external voltage source or an external resistor R_{MODIN}.

For direct setting of bias and the modulation current, the BIASIN and MODIN voltages have to be applied by external voltage sources or by R_{BIASIN} and R_{MODIN} external resistors connected on pins BIASIN and MODIN:

 $I_{BIAS} = (R_{BIASIN} \times 100 \ \mu A - 0.5 \ V) \times g_{m(bias)} \ [mA]$

 $I_{mod} = (R_{MODIN} \times 100 \ \mu A - 0.5 \ V) \times g_{m(mod)} + 5 \ [mA]$

The bias and modulation current sources operate with an input voltage range from 0.5 V to 1.5 V. The output current is at its minimum level for an input voltage below 0.4 V; see Figure 4 and Figure 5.

The bias and modulation current sources are temperature compensated and the adjusted current level remains stable over the temperature range.

The bias and modulation currents increase with increasing resistor values for R_{BIASIN} and R_{MODIN} respectively, this allows resistor tuning to start at a minimum current level.

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

12.1.2 Average monitor current and extinction ratio

The average monitor current $I_{av(MON)}$ in dual-loop or average loop operation is determined by the source current (I_{AVR}) of the AVR pin. The current can be sunk by an external current source or by an external resistor (R_{AVR}) connected to ground:

$$I_{av(MON)} = 1580 - 5.26 \times I_{AVR} = 1580 - 5.26 \times \frac{V_{AVR}}{R_{AVR}}$$
 [µA]

The extinction ratio in dual-loop operation is determined by the source current (I_{ER}) of the ER pin. The current can be sunk by an external current source or by an external resistor

(R_{ER}) connected to ground:
$$ER = 20 - \frac{I_{ER}}{2 \ \mu A} = 20 - \frac{I}{2 \ \mu A} \times \frac{V_{ER}}{R_{ER}}$$

The average monitor current and the extinction ratio as a function of the I_{AVR} and I_{ER} current are illustrated in Figure 6.

The average monitor current increases with a decreasing I_{AVR} or increasing R_{AVR} , this allows resistor tuning of R_{AVR} to start at minimum I_{AVR} current level.

The formulas used to program AVR and ER are valid for typical conditions; tuning is necessary to achieve good absolute accuracy of AVR and ER values.

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

12.1.3 Dual-loop control

The dual-loop control measures the monitor current (I_{MON}) corresponding with an optical 'one' level and the I_{MON} corresponding with the optical 'zero' level. The measured $I_{MON(one)}$ and $I_{MON(zero)}$ are compared with the average monitor current setting and the extinction ratio setting according to:

$$I_{av(MON)} = \frac{I_{MON(one)} + I_{MON(zero)}}{2}$$

$$ER = \frac{I_{MON(one)}}{I_{MON(zero)}}$$

The dual-loop controls the bias and the modulation current for obtaining the $I_{MON(one)}$ and $I_{MON(zero)}$ current levels which correspond with the programmed AVR and ER settings.

Performance of the dual-loop for high data-rate is linked to the quality of the incoming IMON signal: a high performance interconnection between monitor photodiode and MON input is requested for maximum data rate applications (2.7 Gbit/s).

The operational area of the dual-loop and the control area of the monitor input current must respect the following equations:

$$50 \ \mu A < I_{MON(zero)} < 500 \ \mu A$$

250 $\mu A < I_{MON(one)} < 2500 \ \mu A$

Stability of ER and AVR settings are guaranteed over a range of temperature and supply voltage variations.

12.1.4 Alarm operating current

The alarm threshold I_{oper(alarm)} on the operating current is determined by the source current I_{MAXOP} of the MAXOP pin. The current range for I_{MAXOP} is from 10 μ A to 200 μ A which corresponds with an I_{oper(alarm)} from 7.5 mA to 150 mA. The I_{MAXOP} current can be sunk by an external current source or by connecting R_{MAXOP} to ground:

$$I_{oper(alarm)} = N_{MAXOP} \times \frac{V_{MAXOP}}{R_{MAXOP}}$$

The operating current equals the bias current for an AC-coupled laser application and equals the bias current plus half of the modulation current for the DC-coupled laser application:

$$I_{oper(TZA3011A)} = I_{BIAS}$$

$$I_{oper(TZA3011B)} = I_{BIAS} + \frac{I_{mod}}{2}$$

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

12.1.5 Alarm monitor current

The alarm threshold $I_{MON(alarm)}$ on the monitor current is determined by the source current I_{MAXMON} of the MAXMON pin. The current range for I_{MAXMON} is from 10 μ A to 200 μ A which corresponds with an $I_{MON(alarm)}$ from 150 μ A to 3000 μ A. The I_{MAXMON} current can be sunk by an external current source or by connecting R_{MAXMON} to ground:

 $I_{MON(alarm)} = N_{MAXMON} \times \frac{V_{MAXMON}}{R_{MAXMON}}$

12.1.6 Pulse width adjustment

The pulse width adjustment time is determined by the value of resistor R_{PWA} ; see Figure 7.

$$t_{PWA} = 200 \times \frac{R_{PWA} - 10 \ k\Omega}{R_{PWA}}$$
 [ps]

The t_{PWA} range is from –100 ps to +100 ps which corresponds with a R_{PWA} range between a minimum resistance of 6.7 k Ω and a maximum resistance of 20 k Ω . The PWA function is disabled when the PWA input is short-circuited to ground; t_{PWA} equals 0 ps for a disabled PWA function.

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

12.2 TZA3011A with dual-loop control

A simplified application using the TZA3011A with dual-loop control and with an AC-coupled laser at 3.3 V laser voltage is illustrated in Figure 8. The average power level and the extinction ratio are determined by the resistors R_{AVR} and R_{ER} . The MODOUT and BIASOUT outputs are connected to the MODIN and the BIASIN inputs respectively. The alarm threshold on the operating current is made temperature dependent with resistor R_{VTEMP} connected between VTEMP and MAXOP. This alarm detects the end of life of the laser.

$$I_{oper(alarm)} = N_{MAXOP} \times \left(\frac{V_{MAXOP}}{R_{MAXOP}} - \frac{TC_{VTEMP} \times (T_j - 25 \ ^{\circ}C)}{R_{VTEMP}}\right)$$

The resistor R_{PWA} enables pulse width adjustment for optimizing the eye diagram.

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

12.3 TZA3011B with dual-loop control

A simplified application using the TZA3011B with dual-loop control and with a DC-coupled laser at 3.3 V or 5 V laser voltage is illustrated in Figure 9. The average power level and the extinction ratio are determined by the resistors R_{AVR} and R_{ER} . The MODOUT and BIASOUT outputs are connected to the MODIN and the BIASIN inputs respectively.

The open-drain outputs ALOP and ALMON are short-circuited with pin ENABLE causing an active alarm to disable the bias and modulation current sources. The ALRESET input will reset the alarm latches and enable normal operation.

9397 750 14437 Product data sheet

30 Mbit/s up to 3.2 Gbit/s A-rate[™] laser drivers

12.4 TZA3011B with average loop control

A simplified application using the TZA3011B with average loop control and a DC-coupled laser at 3.3 V or 5 V laser voltage is illustrated in Figure 10. The ER pin is short-circuited to ground for the average loop control. The average power level is determined by the resistor R_{AVR}. The average loop controls the bias current and the BIASOUT output is connected to the BIASIN input. The modulation current is determined by the MODIN input voltage which is generated by the resistor R_{MODIN} and the 100 μ A source current of the MODIN pin.

14. Soldering

14.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

14.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 °C to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA, HTSSON..T and SSOP..T packages
 - for packages with a thickness \geq 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

14.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is preferred to be parallel to the transport direction of the printed-circuit board;
