## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Features

- Debounce time: 0.3 ms to 6 s
- RC oscillator determines switching characteristics
- Relay driver with Z-diode
- Debounced input for toggle switch
- Three debounced inputs: ON, OFF and TOGGLE
- Load-dump protection
- RF interference protection
- Protection according to ISO/TR7637-1 (VDE 0839)

## Description

The bipolar integrated circuit Atme ${ }^{\circledR}$ U6032B is designed as a toggle switch. The device, which has a defined power-on status, can be used to control electrical loads, for example, fog lamps, high/low beam or heated windows for automotive applications.

Figure 1. Block Diagram with External Circuit

## 1. Pin Configuration

Figure 1-1. Pinning DIP8

Table 1-1. Pin Description

| Pin | Symbol | Function |
| :---: | :---: | :--- |
| 1 | GND | Reference point, ground |
| 2 | RELAY | Relay control output |
| 3 | ON | Switch-on input |
| 4 | OFF | Switch-off input |
| 5 | TOGGLE | Toggle input |
| 6 | OSC | RC oscillator input |
| 7 | VSTAB | Stabilized voltage |
| 8 | VS | Supply voltage |

## 2. Functional Description

### 2.1 Power Supply, Pin 8

To achieve interference protection and surge immunity, the supply voltage (pin 8) must be provided with an RC circuit as shown in Figure 2-1. The dropping resistor, $R_{1}$, limits the current in case of overvoltage, whereas $C_{1}$ smooths the supply voltage at pin 8.

Recommended values are: $\mathrm{R}_{1}=510 \Omega, \mathrm{C}_{1}=47 \mu \mathrm{~F}$.
An integrated Z-diode (14V) protects the supply voltage, $\mathrm{V}_{\mathrm{S}}$, thus enabling stable operation in a supply-voltage range of 6 V to 16 V , supplied by $\mathrm{V}_{\text {Batt }}$.
It is possible to operate the integrated circuit with a 5 V supply, but it should be assured that there are no interference voltages. In this case, pin 7 is connected to pin 8 as shown in Figure 2-2 on page 4, and the $R_{1} C_{1}$ circuit is omitted.

Figure 2-1. Basic Circuit for 12-V Supply and Oscillator

Figure 2-2. Basic Circuit for $\mathrm{V}_{\mathrm{S}}=5 \mathrm{~V}$

### 2.2 Oscillator, Pin 6

The oscillator frequency, $f$, is determined mainly by the $R_{2} C_{2}$ circuit. The resistance, $R_{2}$, determines the charge time, and the integrated resistance ( $2 \mathrm{k} \Omega$ ) is responsible for the discharge time. To ensure the stability of the oscillator frequency, it is recommended that the selected $R_{2}$ value is remarkably greater than the internal resistance ( $2 \mathrm{k} \Omega$ ), as the temperature response and the tolerances of the integrated resistance are considerably greater than the external resistance value.
The oscillator frequency, $f$, is calculated as follows:
$\mathrm{f}=\frac{1}{\mathrm{t}_{1}+\mathrm{t}_{2}}$
where
$\mathrm{t}_{1}=$ charge time $=\alpha_{1} \times \mathrm{R}_{2} \times \mathrm{C}_{2}$
$\mathrm{t}_{2}=$ discharge time $=\alpha_{2} \times 2 \mathrm{k} \Omega \times \mathrm{C}_{2}$
$\alpha_{1}$ and $\alpha_{2}$ are constants, e.g.:
$\alpha_{1}=0.833$ and $\alpha_{2}=1.551$ when $\mathrm{C}_{2}=470 \mathrm{pF}$ to 10 nF
$\alpha_{1}=0.746$ and $\alpha_{2}=1.284$ when $C_{2}=10 \mathrm{nF}$ to 4700 nF
The debounce time, $t_{3}$, depends on the oscillator frequency, $f$, as follows:
$t_{3}=6 \times \frac{1}{t}$
Table 5-1 on page 8 shows the relationship between $t_{3}, C_{2}, R_{2}$ and frequencies from 1 Hz to 20 kHz .

### 2.3 Relay-control Output

The relay-control output is an open-collector Darlington circuit with an integrated 23-V Z-diode for limiting the inductive cut-off pulse of the relay coil. The maximum static collector current must not exceed 300 mA and the saturation voltage is typically 1.1 V at 200 mA .

### 2.4 Interference Voltages and Load Dump

The IC supply is protected by $R_{1}, C_{1}$, and an integrated $Z$-diode, while the inputs are protected by a series resistor, integrated $Z$ diode and RF capacitor (refer to Figure 2-4 on page 6).
The relay-control output is protected by the integrated 23 V Z-diode in case of short interference peaks. It is switched to conductive condition for a battery voltage greater than 40 V in case of load dump. The output transistor is dimensioned so that it can withstand the generated current.

### 2.5 Power-on Reset

When the operating voltage is switched on, an internal power-on reset pulse (POR) is generated which sets the logic of the circuits to a defined initial condition. The relay output is disabled.

### 2.6 Relay-control Output Behavior, Pin 2

The time functions (relay output) can be started or interrupted by the three inputs ON, OFF or TOGGLE (pins 3,4 and 5 , input circuit of these pins see Figure 2-4 on page 6).
The relay becomes active if the time function is triggered, and the relay contact is interrupted after the elapse of the delay time, $\mathrm{t}_{\mathrm{d}}$. There are two input possibilities.

### 2.7 Toggle Input, Pin 5

When the push-button (TOGGLE) switch, $S_{1}$, is pressed for the first time, the relay becomes active after the debounce time, $t_{3}$, i.e., the relay output, pin 2 , is active.

Repeated operation of $S_{1}$ causes the interruption of the relay contact, thus disabling the relay. Each operation of the toggle switch, $S_{1}$, changes (alters) the condition of the relay output when the debounce time, $t_{d}$, is exceeded, i.e., the TOGGLE function.

If the relay output is not disabled by pressing the switch $S_{1}$, the output stays active.
Figure 2-3. TOGGLE Function

### 2.8 ON, OFF Inputs, Pins 3 and 4

To avoid simultaneous operation of both inputs, pin 3 (ON) and pin 4 (OFF), the use of a two-way contact with centre-off position with spring returns (also known as rocker-actuated switch) is recommended.

Pressing the push-button switch (pin 3 ON ) leads to an activation of the relay after the debounce time, $\mathrm{t}_{3}$, has elapsed whereas the switching of pin 4 switch correspondingly leads to the de-energization of the relay. If the relay is not de-energized by the push-button switch, the output remains active.
Combined operation "TOGGLE" and "ON/OFF" is not possible due to the fact that there is only one debouncing circuit. Debouncing is possible in both modes, i.e., whenever $S_{1}$ is $O N$ or OFF.
Figure 2-4 shows the input circuit of Atmel ${ }^{\circledR}$ U6032B. It has an integrated pull-down resistor (20k $\Omega$ ), RF capacitor (15pF) and Z-diode ( 7 V ). It reacts to voltages greater than 2 V . The external protective resistor has a value of $20 \mathrm{k} \Omega$ and the push-button switch, S , is connected to the battery as shown in the diagram.
The contact current, I, is calculated as follows:
$\mathrm{I}=\frac{\mathrm{V}_{\text {Batt }}-\mathrm{V}_{\mathrm{Z}}}{\mathrm{R}(=20 \mathrm{k} \Omega)}$ where $\mathrm{V}_{\text {Batt }}=12 \mathrm{~V}, \mathrm{~V}_{\mathrm{Z}}=7 \mathrm{~V}$
$\mathrm{I}=\frac{(12-7) \mathrm{V}}{20 \mathrm{k} \Omega} \approx 0.25 \mathrm{~mA}$
It can be increased by connecting a $5.6 \mathrm{k} \Omega$ resistor from the push-button switch to ground as shown in Figure 2-6 on page 7.

## 3. Absolute Maximum Ratings

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

| Parameters | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Operating voltage, static, 5 minutes | $\mathrm{V}_{\text {Batt }}$ | 24 | V |
| Ambient temperature range | $\mathrm{T}_{\text {amb }}$ | -40 to +125 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature range | $\mathrm{T}_{\text {stg }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |
| Junction temperature | $\mathrm{T}_{\mathrm{j}}$ | 150 | ${ }^{\circ} \mathrm{C}$ |

## 4. Thermal Resistance

| Parameters | Symbol | Value | Unit |
| :---: | :---: | :---: | :---: |
| Junction ambient | DIP8 | $\mathrm{T}_{\text {thJA }}$ | 110 |

## 5. Electrical Characteristics

$\mathrm{V}_{\text {Batt }}=13.5 \mathrm{~V}, \mathrm{~T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$, reference point ground, Figure 1 on page 2, unless otherwise specified

| Parameters | Test Conditions | Pin | Symbol | Min. | Typ. | Max. | Unit |
