

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Features

- Temperature and Supply Voltage Compensated Flashing Frequency
- Frequency Doubling Indicates Lamp Outage
- Relay Driver Output with High Current Carrying Capacity and Low Saturation Voltage
- Minimum Lamp Load for Flasher Operation: \geq 1W
- Very Low Susceptibility to EMI
- Protection According to ISO/TR 7637/1 Level 4

1. Description

The bipolar integrated circuit U643B is used in relay-controlled automotive flashers where a high-level EMC is required.

Lamp outage is indicated by frequency doubling during hazard warning as well as direction mode.

Flasher IC with $30\text{-m}\Omega$ Shunt

U643B

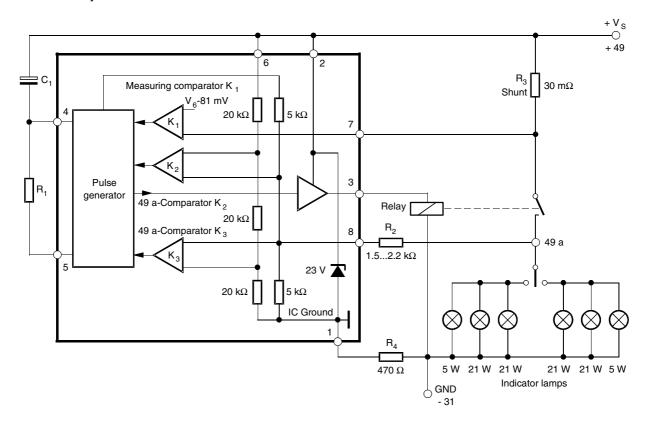

Rev. 4727B-AUTO-09/05

2. Block Diagram

Figure 2-1. Car Flasher Application Circuit, Resistor R₁ and R₂: 0.25W; R₄ for Protection Against Continuous Reversed Polarity: 0.5W

3. Pin Configuration

Figure 3-1. Pinning

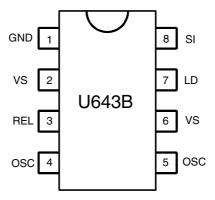

Table 3-1.Pin Description

Pin	Symbol	Function
1	GND	IC ground
2	VS	Supply voltage V _S
3	REL	Relay driver
4	OSC	C ₁ Oscillator
5	OSC	R ₁ Oscillator
6	VS	Supply voltage V _S
7	LD	Lamp failure detection
8	SI	Start input (49a)

4. Functional Description

4.1 Pin 1, GND

The U643B is protected against damage in case of battery reversal via resistor R_4 to ground (-31). An integrated protection circuit together with external resistances R_2 and R_4 limits the current pulses in the IC.

4.2 Pin 2, Supply Voltage, V_S Power

The arrangement of the supply connections to pin 2 must be so as to ensure that on the connection printed circuit board (PCB), the resistance of V_S to pin 6 is lower than that to pin 2.

4.3 Pin 3, Relay Control Output (Driver)

The relay control output is a high-side driver with a low saturation voltage. It is capable of driving a typical automotive relay with a minimum coil resistance of 60Ω

4.4 Pin 4 and 5, Oscillator

The flashing frequency, f_1 , is determined by the R_1C_1 components as given by the formula below (see Figure 2-1 on page 2):

$$f_1 \approx \frac{1}{R_1 \times C_1 \times 1.5} Hz$$

where $C_1 \le 47 \mu F$, $R_1 = 6.8 k\Omega$ to 510 k Ω

In case of a lamp outage (see pin 7) the oscillator frequency is switched to the lamp outage frequency f_2 with $f_2 \approx 2.2 \times f_1$.

Duty cycle in normal flashing mode: 50%

Duty cycle in lamp outage mode: 40% (bright phase)

4.5 Pin 6, Supply Voltage, Sense

For accurate monitoring via the shunt resistor, a minimized layer resistance from point V_S /shunt to pin 6 is recommended.

4.6 Pin 7, Lamp Outage Detection

The lamp current is monitored via an external shunt resistor R_3 and an internal comparator K1 with its reference voltage of typically 81 mV ($V_S = 12V$). The outage of one lamp is detected according to the following calculation:

Nominal current of 1 lamp: $21W / (V_S = 12V)$: $I_{lamp} = 1.75A$

Nominal current of 2 lamps: $2 \times 21 \text{W}$ / (V_{S} = 12V): I_{lamp} = 3.5A.

The detection threshold should be set in the middle of the current range:

$$I_{outage} \approx 2.7A$$

Thus, the shunt resistor is calculated as:

 $R_3 = V_T (K1) / I_{outage}$

 $R_3 = 81 \text{ mV}/2.7\text{A} = 30 \text{ m}\Omega$

Comparator K1's reference voltage is matched to the characteristics of filament lamps (see Control Signal Threshold in "Electrical Characteristics" on page 6).

The combination of shunt resistor and resistance of wire harness prevents pin 7 from a too high voltage in the case of shorted lamps.

4.7 Pin 8, Start Input

Start condition for flashing: the voltage at pin 8 has to be below K3 threshold (flasher switch closed).

Humidity and dirt may decrease the resistance between 49a and GND. If this leakage resistance is > 5 k Ω , the IC still remains in the OFF condition. In this case the voltage at pin 8 is between the thresholds of comparators K2 and K3.

During the bright phase the voltage at pin 8 is above the K2 threshold, during the dark phase it is below the K3 threshold. For proper start conditions a minimum lamp wattage of 1W is required.

5. Absolute Maximum Ratings

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Reference point pin 1

Parameters		Symbol	Value	Unit
