V386

8-BIT LVDS RECEIVER FOR VIDEO

General Description

The V386 is an ideal LVDS receiver that converts 4-pair LVDS data streams into parallel 28 bits of CMOS/TTL data with bandwidth up to 2.38 Gbps throughput or 297.5 Mbytes per second.

This chip is an ideal means to solve EMI and cable size problems associated with wide, high-speed TTL interfaces through very low-swing LVDS signals.

ICS manufactures a large variety of video application devices. Consult ICS for all of your video application requirements.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the V386. These ratings, which are standard values for ICS commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Note: The skew margins mean the maximum timing tolerance between the clock and data channel when the receiver still works well. This margin takes into account the receiver input setup and hold time, and internal clock jitter (i.e., internal data sampling window - RSPos). This margin allows for LVDS transmitter pulse position, interconnect skew, inter-symbol interference and intrinsic channel mismatch which will cause the skew between clock (RC+ and RCK-) and data (RX[n]+ and RX[n]- ; n =0, 1, 2, 3) channels.
