Note: The V700-CD□D-V□ and V700-HMD11(-1) have different command structures.

■ Transmission Time (Reference)

The transmission time is the time required for transmission between the Antenna and ID Tag and does not include time required for host communications.

V700-CD□D-V□

Asynchronous	**Write**	T = 52.8 N + 113.5
	Read	T = 46.7 N + 60.7
Read-only synchronization	**Read**	T = 46.7 N + 107.4
Read-write synchronization	**Write**	T = 52.8 N + 172.4
	Read	T = 52.8 N + 119.6

V700-HMD11/HMD11-1

Read	T = 48 N + 66
Write	T = 55 N + 120

Note: T = Transmission time (ms)
N = Number of pages (1 page = 8 bytes)

Precautions on Using the Product near Noise Sources

This product makes transmissions to ID Tags using a frequency of 125 kHz. Transceivers, motors, monitoring devices, and power supplies have parts that generate electromagnetic waves (noise). These waves may interfere with transmissions to ID Tags. Before using this product near these kinds of devices, check that there is no adverse affect on transmissions.

Multiple Access with the V700-CD□D-V□

The transmission time when using multiple-access commands not only depends on the number of bytes, but also on the number of ID Tags in the transmission range and the combination of the ID Tags' codes. The average values for random ID codes are given below.

(units: ms)

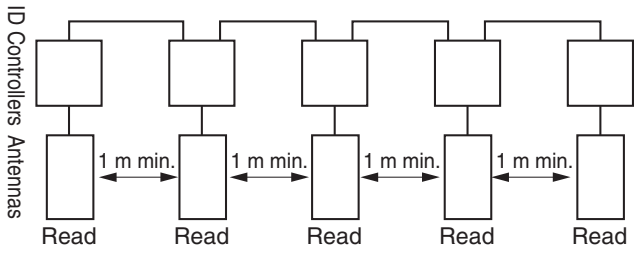
Number of Tags	Reading 8 bytes	Writing 8 bytes
5	579	873
10	1,191	1,547
15	1,857	2,275
20	2,523	3,002
30	3,853	4,455
50	6,344	7,192

■ Mutual Interference Prevention Functions (Using the V700-CD□D-V□)

If there is less than 15 m between Antennas, all the Antennas must be synchronized to prevent mutual interference. This can be done using either of the two methods described below.

Read-only Synchronization

If all the Antennas only use read commands, this method can be used to reduce the access time.



Read/Write Synchronization

This is the synchronization method that is usually used. It enables the synchronization of both read and write commands for several connected Antennas.
