## Overview

The Raven is a compact, rugged board-level embedded computer. It has been engineered and tested to meet the military and medical industries' evolving requirements to develop smaller, lighter, and lower power embedded systems while adhering to stringent regulatory standards. Approximately four inches square and one inch thick, the Raven is a member of the VersaLogic family of small, light, ultra-rugged embedded x86 computers. This embedded computer, equipped with an Intel Atom E38xx "Bay Trail" processor, is designed to withstand extreme temperature, impact, and vibration.

Available in single-, dual-, and quad-core versions, the Raven provides great performance and I/O features, moderate power consumption (6 to 8W typical depending on model), and a compact package. The Raven provides compatibility with a broad range of standard x86 application development tools for reduced development time.

A wide input voltage range of 8 to 30 volts simplifies system power supply requirements. The Raven is fully compatible with 12 or 24V vehicle applications. In addition, Reverse Voltage Protection, and Over Voltage Protection enhances field durability and reliability.
