Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

VMMK-2303

0.5 to 6 GHz 1.8 V E-pHEMT Shutdown LNA in Wafer Level Package

Data Sheet

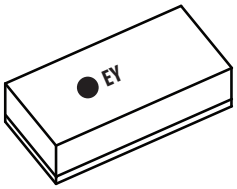
Lead (Pb) Free
RoHS 6 fully
compliant

Description

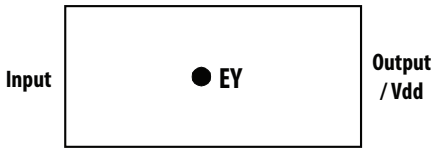
Avago's VMMK-2303 is an easy-to-use GaAs MMIC amplifier that offers excellent noise figure and flat gain from 0.5 to 6 GHz in a miniaturized wafer level package (WLP). It operates from 1.8V CMOS supply or 3.3V battery supply. The bias circuit has incorporated a power down feature which is accessed from the input port.

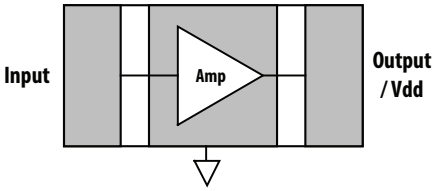
The input and output are matched to 50 Ω (better than 2:1 SWR) across the entire bandwidth; no external matching is needed. This amplifier is fabricated with enhancement E-pHEMT technology and industry leading revolutionary wafer level package. The wafer level package is small and ultra thin yet can be handled and placed with standard 0402 pick and place assembly.

WLP 0402, 1mm x 0.5mm x 0.25 mm



Pin Connections (Top View)





Note:
"E" = Device Code
"Y" = Month Code

Features

- 1 x 0.5 mm Surface Mount Package
- Ultrathin (0.25mm)
- Power down function
- 1.8V Supply
- 50Ohm Input and Output Match
- RoHs6 + Halogen Free

Specifications (3GHz, 1.8V, 21mA Typ.)

- Noise Figure: 2.0dB typical
- Associated Gain: 14dB
- Output IP3: +22dBm
- Output P1dB: +9dBm

Applications

- Low Noise and Driver for Cellular/PCS and WCDMA Base Stations
- 2.4 GHz, 3.5GHz, 5-6GHz WLAN and WiMax notebook computer, access point and mobile wireless applications
- 802.16 & 802.20 BWA systems
- WLL and MMDS Transceivers
- Radar, radio and ECM systems

Attention: Observe precautions for handling electrostatic sensitive devices.
ESD Machine Model = 40V
ESD Human Body Model = 300V
Refer to Avago Application Note A004R:
Electrostatic Discharge, Damage and Control.

Table 1. Absolute Maximum Ratings [1]

Sym	Parameters/Condition	Unit	Absolute Max
Vd	Supply Voltage (RF Output) [2]	V	5
Vc	Power Down Control Voltage	V	3
Id	Device Current [2]	mA	60
$P_{in, max}$	CW RF Input Power (RF Input) [3]	dBm	+13
P_{diss}	Total Power Dissipation	mW	300
Tch	Max channel temperature	°C	150
θjc	Thermal Resistance [4]	°C/W	140

Notes
1. Operation in excess of any of these conditions may result in permanent damage to this device.
2. Bias is assumed DC quiescent conditions
3. With the DC (typical bias) and RF applied to the device at board temperature Tb = 25°C
4. Thermal resistance is measured from junction to board using IR method

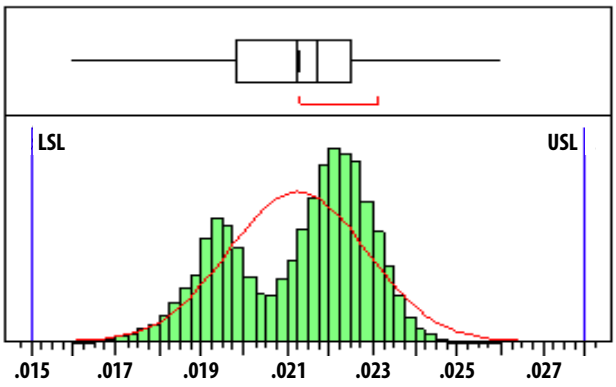
Table 2. DC and RF Specifications

T_A = 25°C, Frequency = 3 GHz, Vd = 1.8V, Vc = 1.8V, $Z_{in} = Z_{out}$ = 50Ω (unless otherwise specified)

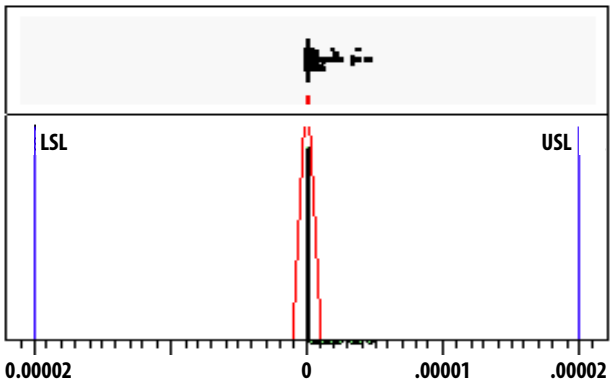
Sym	Parameters/Condition	Unit	Minimum	Typ.	Maximum
Id	Device Current	mA	15	21	28
Id_leakage	Current in Shut Down Mode	µA		0.03	20
NF [1]	Noise Figure	dB	–	2	2.6
Ga [1]	Associated Gain	dB	12	14	16
OIP3 [2,3]	Output 3rd Order Intercept	dBm		+22	–
Output P-1dB [2]	Output Power at 1dB Gain Compression	dBm		+9	–
IRL [2]	Input Return Loss	dB	–	-13	–
ORL [2]	Output Return Loss	dB	–	-19	–

Notes:
1. Measure data obtained using 300um G-S probe on production wafers
2. Measure data obtained using 300um G-S-G probe on PCB substrate
3. OIP3 test condition: F1=3.0GHz, F2=3.01GHz, Pin=-20dBm

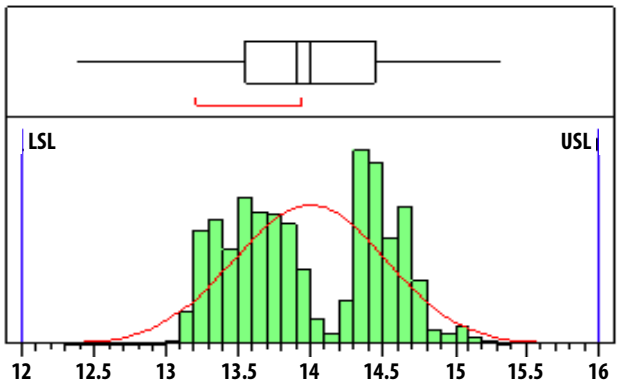
Product Consistency Distribution Charts at 3.0 GHz, Vd = 1.8 V, Vc = 1.8V



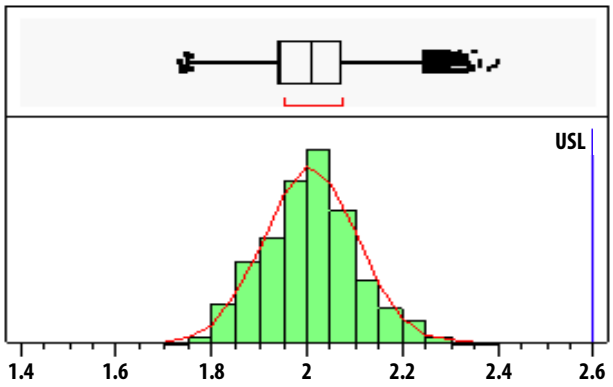
Id at Vd=Vc=1.8V, LSL=15mA, Mean=21mA, USL=28mA



Id_Off at Vd=1.8V & Vc=0V, Mean=0.025uA, USL=20uA



Gain at 3GHz, LSL=12 dB, Mean=14 dB, USL=16 dB



NF at 3GHz, Mean=2 dB, USL=2.6 dB

Note:
Distribution data based on 500 part sample size from 3 lots during initial characterization.
Measurements were obtained using 300um G-S production wafer probe.
Future wafers allocated to this product may have nominal values anywhere between the upper and lower limits.

VMMK-2303 Application and Usage

(Please always refer to the latest Application Note AN5378 in website)

Biasing and Operation

The VMMK-2303 can be used as a low noise amplifier or as a driver amplifier. The nominal bias condition for the VMMK-2303 is Vd=Vc=1.8V. At this bias condition the VMMK-2303 provides an optimal compromise between power consumption, noise figure, gain, power output and OIP3. The VMMK-2303 can also be operated a Vd of 3.3V and a Vc of 1.8V which will result in higher P1dB and OIP3.

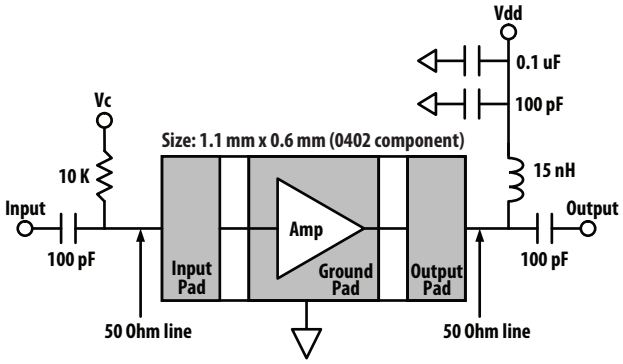

Figure 19. Example application of VMMK-2303 at 3GHz

At Vc=1.8V, the corresponding drain currents are approximately 21 and 23 mA at Vd of 1.8V and 3.3V respectively.

The VMMK-2303 is biased with a positive supply connected to the output pin through an external user supplied bias-tee as shown in Figure 19. The power down feature (Vc) at the input port is accessed through an external 10kΩ resistor. The resistor will have minimal effect on circuit performance. The LNA is turned on when Vc is at 1.8V and shut off when Vc is at 0V. In a typical application, the bias-tee on the output port can be constructed using lumped elements. The value of the output inductor can have a major effect on both low and high frequency operation. The demo board uses a 15 nH inductor that has self resonant frequency higher than the maximum desired frequency of operation. If the self-resonant frequency of the inductor is too close to the operating band, the value of the inductor needs to be adjusted so that the self-resonant frequency is significantly higher than the highest frequency of operation. Extending the low frequency response of the VMMK-2303 is possible by using two different value inductors in series with the smaller value inductor placed closest to the device and favoring the higher frequencies. The larger value inductor will then offer better low frequency performance by not loading

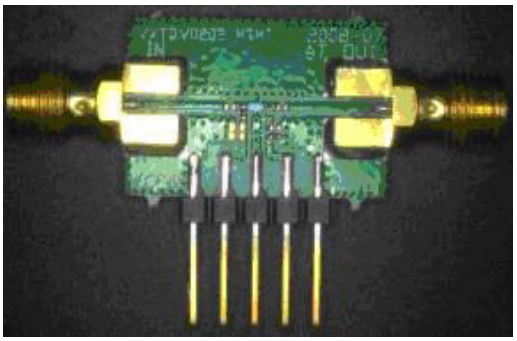

Figure 20. Evaluation/Test Board (available to qualified customer request)

the output of the device. The parallel combination of the 100pF and 0.1uF capacitors provide a low impedance in the band of operation and at lower frequencies and should be placed as close as possible to the inductor. The low frequency bypass provides good rejection of power supply noise and also provides a low impedance termination for third order low frequency mixing products that will be generated when multiple in-band signals are injected into any amplifier. It is also suggested that a 0.1uF capacitor be used to bypass the 10kΩ resistor that feeds the Vc terminal. This will prevent noise and other spurious from affecting the noise figure of the VMMK-2303.

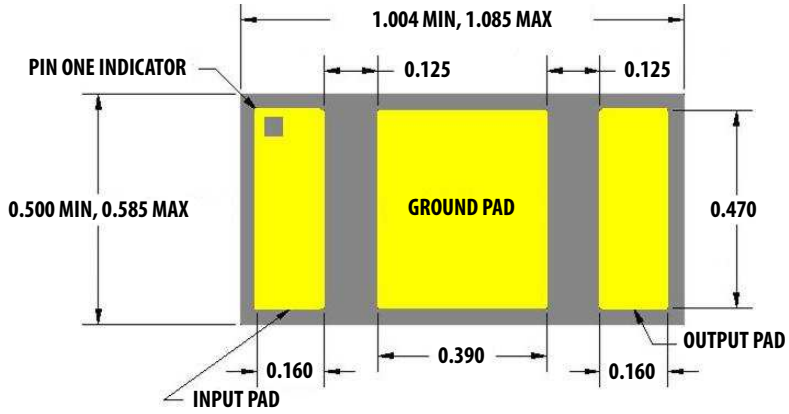
Refer the Absolute Maximum Ratings table for allowed DC and thermal conditions.

S Parameter Measurements

The S-parameters are measured on a .016 inch thick RO4003 printed circuit test board, using G-S-G (ground signal ground) probes. Coplanar waveguide is used to provide a smooth transition from the probes to the device under test. The presence of the ground plane on top of the test board results in excellent grounding at the device under test. A combination of SOLT (Short - Open - Load - Thru) and TRL (Thru - Reflect - Line) calibration techniques are used to correct for the effects of the test board, resulting in accurate device S-parameters. The reference plane for the S Parameters is at the edge of the package.

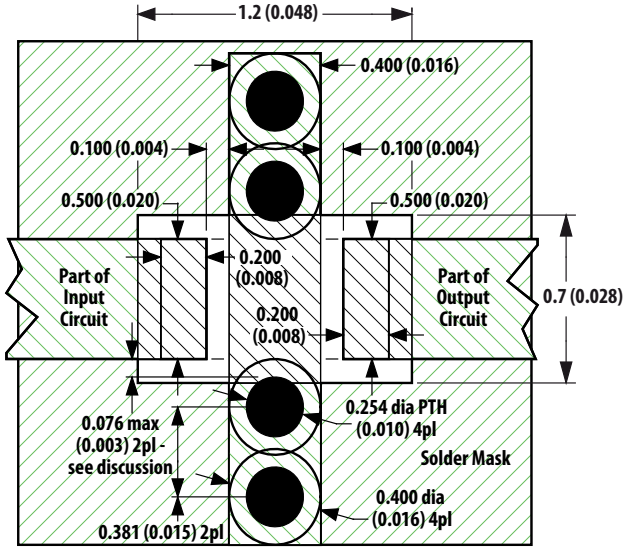
The product consistency distribution charts shown on page 2 represent data taken by the production wafer probe station using a 300um G-S wafer probe. The ground-signal probing that is used in production allows the device to be probed directly at the device with minimal common lead inductance to ground. Therefore there will be a slight difference in the nominal gain obtained at the test frequency using the 300um G-S wafer probe versus the 300um G-S-G printed circuit board substrate method.

Outline Drawing



Notes:
Solderable area of the device shown in yellow.
Dimensions in mm.
Tolerance ± 0.015 mm

Suggested PCB Material and Land Pattern



Notes:
1. 0.010" Rogers RO4350

Recommended SMT Attachment

The VMMK Packaged Devices are compatible with high volume surface mount PCB assembly processes.

Manual Assembly for Prototypes

1. Follow ESD precautions while handling packages.
2. Handling should be along the edges with tweezers or from topside if using a vacuum collet.
3. Recommended attachment is solder paste. Please see recommended solder reflow profile. Conductive epoxy is not recommended. Hand soldering is not recommended.
4. Apply solder paste using either a stencil printer or dot placement. The volume of solder paste will be dependent on PCB and component layout and should be controlled to ensure consistent mechanical and electrical performance. **Excessive solder will degrade RF performance.**
5. Follow solder paste and vendor's recommendations when developing a solder reflow profile. A standard profile will have a steady ramp up from room temperature to the pre-heat temp to avoid damage due to thermal shock.
6. Packages have been qualified to withstand a peak temperature of 260°C for 20 to 40 sec. Verify that the profile will not expose device beyond these limits.
7. Clean off flux per vendor's recommendations.
8. Clean the module with Acetone. Rinse with alcohol. Allow the module to dry before testing.
