VMMK-3413

25 - 45 GHz Directional Detector in SMT Package

Data Sheet

Description

The VMMK-3413 is a small and easy-to-use, broadband, directional detector operating in various frequency bands from 25 to 45 GHz with typical insertion loss of 0.8 dB. It is housed in the Avago Technologies' industry-leading and revolutionary sub-miniature chip scale package (GaAsCap wafer scale leadless package) which is small and ultra thin yet can be handled and placed with standard 0402 pick and place assembly equipment. The VMMK-3413 provides a wide detecting power level from -5 to +30 dBm with excellent input and output return losses. A typical of 10 dB directivity is provided, and the detector requires only 1.5 V DC biasing with small current drawn of 0.16 mA.

Notes

- 1. Measured data obtained from wafer-probing, losses from measurement system de-embedded from final data, Vbias = 1.5 V applied through a broadband bias tee.
- 2. Measured by reversing the detector and applying RF power to the output port. Directivity is defined as the difference in dB between the power applied in the forward direction and the power required in the reverse direction to produce the same Vdet voltage.
- 3. Voffset is measured with RF input power turned off.
- 4. Vdet is measured with +12 dBm RF input power at 35 GHz.

VMMK-3413 Biasing Information

Biasing and Operation

The VMMK-3413 is a 3 terminal device consisting of a "through" 50 ohm line connecting directly between the RF Input and RF Output ports and a directional coupler with a full wave detector that provides a DC output proportional to RF power input. As with any high frequency device, good grounding is required on the common port under the device for it to produce low loss in the "through" mode. A suggested PCB layout with appropriate grounding will be cover later in the application section.

With only 3 terminals available, the DC bias and detected voltage are internally DC coupled to the input and output terminals respectively. The key to successful operation of the VMMK-3413 is the use of low loss bias decoupling networks connected to both the RF Input and the RF Output ports. Figure 7 shows a simple biasing circuit.

The bias decoupling networks provide a low loss AC coupled RF path to the device, a means of biasing the device on the input, and a means of extracting the detected voltage on the output of the device. The detector needs 2 DC blocking caps, C1 and C2, on the input and output ports. This can be accomplished by printing coupled lines on the PCB or using SMT capacitors (ATC 600 series) with

Component	Description
C1, C2	0.1 pF (ATC 600 series or printed coupled lines)
R1	(Vb -1.5) / 0.00016 Ω
R2	10 kΩ
C3, C4	1 pF
R3	External load resistor (optional)

values chosen for the frequency of operation. All SMT components are recommended to be no larger than 0402 size. Nominal bias voltage of 1.5 V or 0.16 mA is required for proper operation. Biasing on the input is by a way of a large value resistor R1. Its value can be computed using the following equation:

R1 = (Vb - 1.5)/0.00016

where Vb is the supply voltage.

Detected DC voltage is extracted on the output by a way of a large value resistor R2, in the range of $10 \, k\Omega$. Bypassing capacitors C3 and C4 are needed to prevent RF influence on the DC lines. Suggested value for bypass capacitors is 1 pF.

At zero RF input power, and at 1.5 V supply bias, a nominal 63 mV offset voltage appears at the detected output port. The internal output source resistance for the detector is approximately 20 k Ω . Resistor R3 can be used as an external load resistor for the detector. Its value can be optimized for the desired Vout vs. RF input curve.

Figure 8 shows a characterization PCB used to obtain the Vdet vs. Input Power characterization data from 25 to 45 GHz. For ease in broadband characterization, two external 45 MHz – 50 GHz Bias Networks (HP 11612B) were used.

S Parameter Measurements

The S-parameters are measured on a 0.016 inch thick RO4003 printed circuit test board, using 300 μm G-S-G (ground signal ground) probes. Coplanar waveguide is used to provide a smooth transition form the probes to the device under test. The presence of the ground plane on top of the test board results in excellent grounding at the device under test. A combination of SOLT (Short – Open – Load – Thru) and TRL (Thru – Reflect –-Line) calibration techniques are used to correct for the effects of the test board, resulting in accurate device S parameters

ESD Precautions

Note: These devices are ESD sensitive. The following precautions are strongly recommended. Ensure that an ESD approved carrier is used when die are transported from one destination to another. Personal grounding is to be worn at all times when handling these devices. For more detail, refer to Avago Application Note A004R: Electrostatic Discharge Damage and Control
