Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

VN610SP-E

Single channel high-side driver

Features

Type	$R_{DS(on)}$	I_{OUT}	V_{CC}
VN610SP-E	10mΩ	45 A	36V

- ECOPACK®: lead free and RoHS compliant
- Automotive Grade: compliance with AEC guidelines
- Output current: 45 A
- CMOS compatible inputs
- Proportional load current sense
- Undervoltage and overvoltage shutdown
- Overvoltage clamp
- Thermal shutdown
- Current limitation
- Very low standby power consumption
- Protection against loss of ground and loss of V_{CC}
- Reverse battery protected
- In compliance with the 2002/95/EC european directive

PowerSO-10
Description

The VN610SP-E is a monolithic device made using STMicroelectronics™ VIPower™ M0-3 technology. It is intended for driving resistive or inductive loads with one side connected to ground.

Active V_{CC} pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility table). This device integrates an analog current sense which delivers a current proportional to the load current (according to a known ratio).

Active current limitation combined with thermal shutdown and automatic restart protect the device against overload. Device automatically turns off in case of ground pin disconnection.

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the "Absolute maximum ratings" table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality document.

Table 3. Absolute maximum ratings

3   Application information

Figure 19.   Application schematic

3.1   GND protection network against reverse battery

This section provides two solutions for implementing a ground protection network against reverse battery.

3.1.1   Solution 1: a resistor in the ground line (R$_{GND}$ only)

This can be used with any type of load.

The following show how to dimension the R$_{GND}$ resistor:

1. $R_{GND} \leq 600mV / (I_{S(on)max})$
2. $R_{GND} \geq (- V_{CC}) / (- I_{GND})$

where - I$_{GND}$ is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power dissipation in R$_{GND}$ (when V$_{CC}$ < 0 during reverse battery situations) is:

$$P_D = (- V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where I$_{S(on)max}$ becomes the sum of the maximum on-state currents of the different devices.

Please note that, if the microprocessor ground is not shared by the device ground, then the R$_{GND}$ produces a shift (I$_{S(on)max}$ * R$_{GND}$) in the input thresholds and the status output values. This shift varies depending on how many devices are ON in the case of several high-side drivers sharing the same R$_{GND}$.

If the calculated power dissipation requires the use of a large resistor, or several devices have to share the same resistor, then ST suggests using solution 2 below.

3.1.2 Solution 2: a diode (D$_{GND}$) in the ground line

A resistor (R$_{GND}$ = 1kΩ) should be inserted in parallel to D$_{GND}$ if the device is driving an inductive load. This small signal diode can be safely shared amongst several different HSD. Also in this case, the presence of the ground network produces a shift (j600mV) in the input threshold and the status output values if the microprocessor ground is not common with the device ground. This shift not varies if more than one HSD shares the same diode/resistor network. Series resistor in INPUT and STATUS lines are also required to prevent that, during battery voltage transient, the current exceeds the Absolute Maximum Rating. Safest configuration for unused INPUT pin is to leave them unconnected, while unused SENSE pin has to be connected to ground pin.

3.2 Load dump protection

D$_{ld}$ is necessary (voltage transient suppressor) if the load dump peak voltage exceeds the V$_{CC}$ maximum DC rating. The same applies if the device is subject to transients on the V$_{CC}$ line that are greater than those shown in the ISO T/R 7637/1 table.

3.3 MCU I/O protection

If a ground protection network is used and negative transients are present on the V$_{CC}$ line, the control pins is pulled negative. ST suggests to insert a resistor (R$_{prot}$) in line to prevent the µC I/O pins from latching up.

The value of these resistors is a compromise between the leakage current of µC and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of µC I/Os:

$$- V_{CCpeak} / I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Example

For the following conditions:

V$_{CCpeak}$ = - 100V
I$_{latchup}$ ≥ 20mA
V$_{OH\mu C}$ ≥ 4.5V
5kΩ ≤ R$_{prot}$ ≤ 65kΩ.

Recommended values are:

R$_{prot}$ = 10kΩ

3.4 Maximum demagnetization energy (V_{CC} = 13.5 V)

Figure 20. Maximum turn-off current versus load inductance[1]

A = single pulse at T_{Jstart} = 150ºC

B= repetitive pulse at T_{Jstart} = 100ºC

C= repetitive pulse at T_{Jstart} = 125ºC

1. Values are generated with R_L = 0Ω.
   In case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.
