

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

ISO HIGH SIDE SMART POWER SOLID STATE RELAY

TYPE	V _{DSS}	R _{DS(on)}	I _{OUT}	V _{CC}
VND10BSP	40 V	0.1 Ω	3.4 A	26 V

- OUTPUT CURRENT (CONTINUOUS):
14A @ T_c = 85°C PER CHANNEL
- 5V LOGIC LEVEL COMPATIBLE INPUT
- THERMAL SHUT-DOWN
- UNDER VOLTAGE PROTECTION
- OPEN DRAIN DIAGNOSTIC OUTPUT
- INDUCTIVE LOAD FAST
DEMAGNETIZATION
- VERY LOW STAND-BY POWER
DISSIPATION

DESCRIPTION

The VND10BSP is a monolithic device made using SGS-THOMSON Vertical Intelligent Power Technology, intended for driving resistive or inductive loads with one side grounded. This device has two channels, and a common diagnostic. Built-in thermal shut-down protects the chip from over temperature and short circuit.

The status output provides an indication of open load in on state, open load in off state, overtemperature conditions and stuck-on to V_{CC}.

**FUNCTIONAL DESCRIPTION**

The device has a diagnostic output which indicates open load in on-state, open load in off-state, over temperature conditions and stuck-on to V_{CC} .

From the falling edge of the input signal, the status output, initially low to signal a fault condition (overtemperature or open load on-state), will go back to a high state with a different delay in case of overtemperature ($tpovl$) and in case of open open load ($tpol$) respectively. This feature allows to discriminate the nature of the detected fault. To protect the device against short circuit and over current condition, the thermal protection turns the integrated Power MOS off at a minimum junction temperature of $140\text{ }^{\circ}\text{C}$. When this temperature returns to $125\text{ }^{\circ}\text{C}$ the switch is automatically turned on again. In short circuit the protection reacts with virtually no delay, the sensor being located inside the Power MOS area. An internal function of the devices ensures the fast demagnetization of inductive loads with a typical voltage (V_{demag}) of -18V . This function allows to greatly reduces the power dissipation according to the formula:

$$P_{dem} = 0.5 \cdot I_{load} \cdot (I_{load})^2 \cdot [(V_{CC} + V_{demag}) / V_{demag}] \cdot f$$

where f = switching frequency and V_{demag} = demagnetization voltage.

The maximum inductance which causes the chip

temperature to reach the shut-down temperature in a specified thermal environment is a function of the load current for a fixed V_{CC} , V_{demag} and f according to the above formula. In this device if the GND pin is disconnected, with V_{CC} not exceeding 16V , it will switch off.

PROTECTING THE DEVICE AGAINST REVERSE BATTERY

The simplest way to protect the device against a continuous reverse battery voltage (-26V) is to insert a Schottky diode between pin 1 (GND) and ground, as shown in the typical application circuit (fig.3).

The consequences of the voltage drop across this diode are as follows:

If the input is pulled to power GND, a negative voltage of $-V_f$ is seen by the device. (V_{il} , V_{ih} thresholds and V_{stat} are increased by V_f with respect to power GND).

The undervoltage shutdown level is increased by V_f .

If there is no need for the control unit to handle external analog signals referred to the power GND, the best approach is to connect the reference potential of the control unit to node [1] (see application circuit in fig. 3), which becomes the common signal GND for the whole control board avoiding shift of V_{ih} , V_{il} and V_{stat} . This solution allows the use of a standard diode.
