

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Precision Voltage Reference

FEATURES

- ◆ Very High Accuracy: +10 V Output, ± 0.5 mV
- ◆ Extremely Low Drift: 1.11 ppm/°C (-55°C to +125°C)
- ◆ Low Warm-up Drift: 1 ppm Typical
- ◆ Excellent Stability: 6 ppm/1000 Hrs. Typical
- ◆ Excellent Line Regulation: 3 ppm/V Typical
- ◆ Hermetic 20-terminal Ceramic LCC Package
- ◆ Military Processing Option

APPLICATIONS

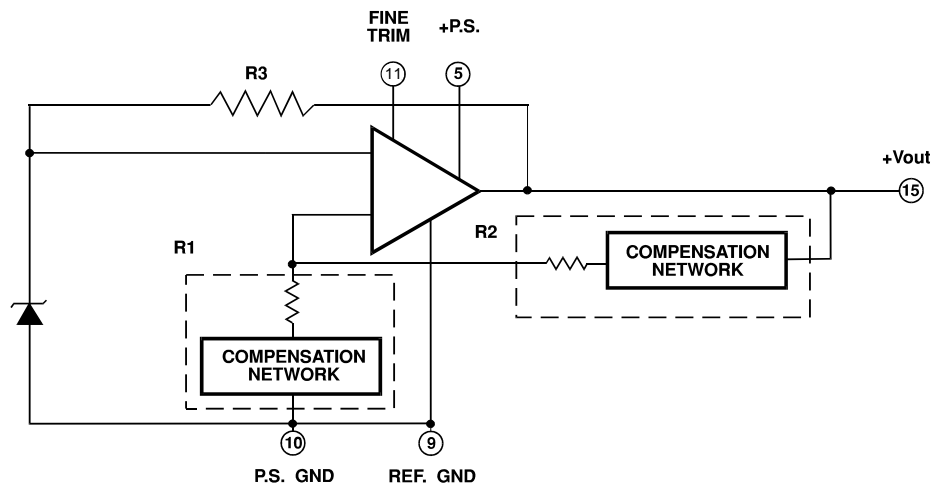

- ◆ Precision A/D and D/A Converters
- ◆ Transducer Excitation
- ◆ Accurate Comparator Threshold Reference
- ◆ High Resolution Servo Systems
- ◆ Digital Voltmeters
- ◆ High Precision Test and Measurement Instruments

DESCRIPTION

VRE210 Series Precision Voltage References provide ultrastable +10 V outputs with ± 0.5 mV initial accuracy and temperature coefficient as low as 1.11 ppm/°C over the full military temperature range. This improvement in accuracy is made possible by a unique, proprietary multipoint laser compensation technique. Significant improvements have been made in other performance parameters as well, including initial accuracy, warm-up drift, line regulation, and long term stability, making the VRE210 series the most accurate and stable 10 V surface mount references available.

VRE210 devices are available in two operating temperature ranges, -25°C to +85°C and -55°C to +125°C, and two electrical performance grades. All devices are packaged in 20-terminal ceramic LCC packages for maximum long-term stability. "M" versions are screened for high reliability and quality.

Figure 1. BLOCK DIAGRAM

SELECTION GUIDE

Model	Output (V)	Temperature Operating Range	Volt Deviation (Max)
VRE210CA	+10	-25°C to +85°C	± 0.6 mV
VRE210M	+10	-55°C to +125°C	± 1.2 mV
VRE210MA	+10	-55°C to +125°C	± 1.0 mV

**20-terminal Ceramic LCC
Package Style HD**

1. CHARACTERISTICS AND SPECIFICATIONS

ELECTRICAL SPECIFICATIONS

$V_{PS} = +15V$, $T = +25^{\circ}C$, $R_L = 10K\Omega$ Unless Otherwise Noted.

Model	VRE210CA			VRE210M			VRE210MA			
Parameter	Min	Typ	Max	Min	Typ	Max	Min	Typ	Max	Units
ABSOLUTE MAXIMUM RATINGS										
Power Supply	+13.5		+22	*		*	*		*	V
Operating Temperature	-25		-85	-55		+125	-55		+125	$^{\circ}C$
Storage Temperature	-65		+150	*		*	*		*	$^{\circ}C$
Short Circuit Protection	Continuous			*			*			
OUTPUT VOLTAGE										
VRE210		+10			*			*		V
OUTPUT VOLTAGE ERRORS										
Initial Error			± 500			± 1000			± 800	μV
Warmup Drift		1			2			1		ppm
$T_{MIN} - T_{MAX}$ (Note1)			600			1200			1000	μV
Long-Term Stability		6			*			*		ppm/1000hrs
Noise (0.1 - 10Hz)		6			*			*		μV_{pp}
OUTPUT CURRENT										
Range	± 10			*			*			mA
REGULATION										
Line		3	10		*	*		*	*	ppm/V
Load		3			*			*		ppm/mA
OUTPUT ADJUSTMENT										
Range		20			*			*		mV
Temperature Coefficient		4			*			*		mV/ $^{\circ}C$ /mV
POWER SUPPLY CURRENT (Note 2)										
VRE210 +PS		5	7		*	*		*	*	mA

NOTES:

- * Same as CA Models.
- 1. Using the box method, the specified value is the maximum deviation from the output voltage at $25^{\circ}C$ over the specified operating temperature range.
- 2. The specified values are unloaded.

2. TYPICAL PERFORMANCE CURVES

3. THEORY OF OPERATION

The following discussion refers to the block diagram in Figure 1. In operation, approximately 6.3 volts is applied to the noninverting input of the op amp. The voltage is amplified by the op amp to produce a 10 V output. The gain is determined by the networks R1 and R2: $G=1 + R2/R1$. The 6.3V zener diode is used because it is the most stable diode over time and temperature.

The zener operating current is derived from the regulated output voltage through R3. This feedback arrangement provides a closely regulated zener current. This current determines the slope of the references' voltage vs. temperature function. By trimming the zener current a lower drift over temperature can be achieved. But since the voltage vs. temperature function is nonlinear this compensation technique is not well suited for wide temperature ranges.

A nonlinear compensation network of thermistors and resistors that is used in the VRE series voltage references. This proprietary network eliminates most of the nonlinearity in the voltage vs. temperature function. By then adjusting the slope, Thaler Corporation produces a very stable voltage over wide temperature ranges. This network is less than 2% of the overall network resistance so it has a negligible effect on long term stability. By using highly stable resistors in our network, we produce a voltage reference that also has very good long term stability.

4. APPLICATION INFORMATION

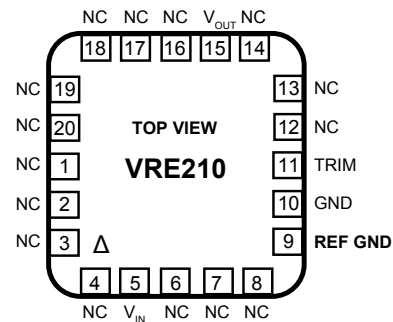

The proper connection of the VRE210 series voltage references with the optional trim resistor is shown below. Pay careful attention to the circuit layout to avoid noise pickup and voltage drops in the lines.

The VRE210 series voltage references have the ground terminal brought out on two pins (pin 9 and pin 10) which are connected together internally. This allows the user to achieve greater accuracy when using a socket. Voltage references have a voltage drop across their power supply ground pin due to quiescent current flowing through the contact resistance. If the contact resistance was constant with time and temperature, this voltage drop could be trimmed out. When the reference is plugged into a socket, this source of error can be as high as 20 ppm. By connecting pin 10 to the power supply ground and pin 9 to a high impedance ground point in the measurement circuit, the error due to the contact resistance can be eliminated. If the unit is soldered into place, the contact resistance is sufficiently small that it does not effect performance.
